The Marquess of Bute has given instructions for the immediate carrying out of a most important tree-planting scheme, which will not only afford welcome employment for some little time, but will eventually greatly add to the beauty of one of the finest scenes in Scotland, namely, the Kyles of Bute. The supply of native wood for railway, colliery and such purposes is getting rather scarce, and apart from the æsthetic aspect there can be no doubt this scheme is a most promising commercial one. It is believed that a good many thousand pounds will be invested.

**Annual Dinner of the N.C.S.**

The annual dinner and presentation of prizes will take place in the Caledonian Salon, Holborn Restaurant, High Holborn, W.C., on Wednesday, November 25, 1903, at 6.15 p.m. sharp, Charles E. Shea, Esq. (President of the Society), will preside. The committee are most desirous that as the annual dinner will be the first occasion of meeting the new president, the members will make a point of being present, and particularly requests the presence of exhibitors at the November show entitled to receive cups or medals. In order that adequate accommodation may be provided, all tickets not returned by November 23 will be considered as sold. The challenge trophy, the Holmes' Memorial, and other cups and medals will be presented to the winners during the evening. On this occasion the presence of ladies is specially desired.—RICHARD DEAN, Secretary.

**Dahlias at Ottershaw.**

The pretty little village of Ottershaw, near Chertsey, seems to have its ground chiefly occupied by nurseries, and the well-known nursery of Fletcher Brothers holds the chief position. Mr. W. Eacott, a gardener in a neighbouring place, with the help of his partner, is able to grow a large collection of Dahlias for supplying the trade and private growers. We found they had not made so much rank growth as one would have expected in a year like this, but the plants were covered with some good blooms. Prominent amongst them was the following:—J. H. Jackson, brilliant crimson maroon, very large, and one of the best; Lord Roberts, a splendid white Cactus; Red Rover, described by the grower as the largest Cactus he had, clear crimson scarlet; General French, a warm terra-cotta; Mrs. Edward Mawley, a very fine yellow; and many other Cactus and show Dahlias. There was also a good collection of Pompons.—A. J. B.

**Proposed Horticultural College at Wisley.**

The Surrey Education Committee (says the "Standard") have under their consideration a memorandum, prepared by Mr. J. R. Dunstan, Principal of the South-Eastern Agricultural College, at Wye, and Mr. H. Mason, Secretary to the Committee, on the question of the desirability of establishing a horticultural college at Wisley, Surrey, in close proximity to the gardens there recently presented to the Royal Horticultural Society. The suggested college would be regarded as a branch of Wye College, which is maintained by Surrey and Kent, and it is believed that the Royal Horticultural Society would be willing to co-operate in the matter, and be prepared to give facilities for students receiving scientific tuition in the college to have practical instruction in horticulture in the Society's gardens. It is suggested that a forestry station, financed by the Board of Agriculture, might be established in connection with the college. Information as to the Society's intention in connection with the new gardens at Wisley is awaited before a definite proposal is put before the Education Committee and the County Council.

### Notes on Some of the Newer Roses.

(Concluded from page 440.)

Mamie, the last on the list of H.T.'s, first shown as Mrs. Conway Jones (I hope Messrs. Dickson will not alter the name under which a Rose has once been shown; if they can avoid it), is a Rose whose manners and customs have puzzled me much. I had a pot plant of it from Messrs. Dickson in June, 1901, when it came out of the usual calibre, and had sufficient growth from it to be able to bud four or five standards. The maiden growths proved last year, to my surprise, extremely weak, and the plants no good whatever, either that year or this. Later, last year, I had a bloom on the original dwarf (I suppose grafted) plant, which pleased me much, and I budded three or four more standards; and later still the original plant sent up an unusually strong shoot for a grafted plant. Once more, this year, the budded standards have been utterly weak and useless, while the original dwarf plant has yielded me two or three of as fine hot-weather show blooms as could be wished. Needless to say I have taken the hint and budded it this year largely on dwarf stocks, and if this really is its preference, it is decidedly an unusual "custom" for a Hybrid Tea. The flowers were large, of good shape and colour, and very solid and full; they proved to be decidedly the best Roses to last that I have ever cut, except from the pure Teas. I showed one flower at two successive shows, both of which were hot days; and though I have often managed this with Teas, I never have done it before with any other Rose, and it would be very rarely that one could do it with Tea of this colour, a rather deep pink. It seemed to me a variety that requires hot weather, and does not require to be tied up—both of which are very good qualities. I think it should prove very useful indeed to exhibitors, and would recommend those who have not yet tried it to get dwarf plants.

There is another H.T., Robert Scott (Robert Scott and Son, 1901), of the same year, which Mr. Mawley did not put forward as a candidate in the new Rose Election, though it appears in his general Analysis. This Rose, we have been informed by the raisers, is a cross between Merveille de Lyon, H.P., and Mrs. W. J. Grant, H.T. The flower bears occasionally some resemblance to Her Majesty, and cannot fail to raise once more the question, What is a Hybrid Tea? Her Majesty was, we have been told (but I do not know whether the information came from Mr. Bennett or anyone authorised by him) a cross between Mabel Morrison, H.P., and the old Tea Canary. If so, Her Majesty was, by birth, not H.P. but H.T. But the N.R.S., I believe, decide the class of any Rose, not by birth certificates but by individual characteristics. By both of these tests Robert Scott should be H.P., not H.T., for it is not only a cross between H.P. and H.T., while Her Majesty, called H.P., is a cross between H.P. and T., but in all its characteristics is essentially H.P. Nevertheless, being a loyal member of the N.R.S., and not inclined to play the part of a "passive resister" H.T. it will be with me as long as authority so decides.—W. R. RAILLEM.

### New Rose, Urania.

This new Rose is one of the productions of M. H. Walsh, of Woods Holl, Mass. A seedling of American Beauty crossed with Mdle. Suzanne Marie Rodocanachi, it has all the good characteristics of the American Beauty excepting the strong characteristic fragrance, and is of a lighter and much more glowing colour. The foliage is heavy and waxy.

## The Ebb and Flow of Gardening.

"Gone to the dogs! They're marketing"—the answer verbatim to enquiry anent a once noted garden. What dogs have to do with the deplorable decadence in many of the high places of the gardening world, unless it be that much growling goes with it, it is hard to say; but the fact remains that the perversion of grand old gardens into market growing establishments is, unfortunately, becoming more and more evident. There seems to be, too, some inseparable connection between going to the market and going to the dogs, for once a start is made in selling the surplus, a run on the down grade seems quick and easy to the canine ending. *Sic transit gloria horti.*

The marketing phase of private gardening is as insidious and infectious as it appears to be demoralising. Poverty probably started it, custom oft continues what necessity no longer impels, and example spreads this commercial culture until it appears likely to permeate the whole land.

Judgment is formed on personal knowledge, which, in the case of gardeners, is often gleaned from a restricted area of observation; and these remarks, emanating, as they do, from a district where a form of marketing madness not only runs rampant, but is highly contagious, the trend of opinion may, possibly does, reach the other extreme. Market growers and nurserymen have hitherto suffered in silence, but with high rents, increased taxation, and the additional burden of this illegitimate competition, the wisdom of seeking protection for themselves will sooner or later be forced upon them.

Free trade, in this instance, is not fair trade, and with the very pertinent, but at the same time, very bad example, of the gardens attached to the residences of high Government officials, for the upkeep of which certain sums of public money are granted by the Board of Works, being transposed into, practically market gardens, should be sufficient excuse for broaching the theme if any excuse is wanted. Not only is it that the market grower, pure and simple, is affected; viz., those who cater for the vegetable and fruit supplies of our city, but in the bad examples referred to, local nurserymen and florists have to compete with nearly all the products of the glass department from these places, including plants and forced flowers. Anything, in fact, which will make money, although the family's supplies are considered; but the chief end and aim is, although it may not be acknowledged, *the market.*

Seedsmen suffer, although this is not apparent at first sight, but where large batches of "stuff" are manufactured for the market, the one-time nobleman's gardener—still retaining the title by courtesy—who is now perverted or converted, which you will, into a market man, is apt to send for his Aster seeds or what not to Germany, and obtain his bulbs from wholesale dealers in Holland, anywhere, in fact, by which a saving is effected. Apart, however, from all practical considerations which are, probably, powerless to alter existing conditions, or even stop them, in going from bad to worse, the deteriorating effect of marketing in private gardens must always be a matter of regret. Over the entrance to many might be suitably inscribed Ichabod, its glory has departed, and in all human probability it has ebbed never to return. In other channels is the returning flow diverted, and there is more than a little satisfaction, if not compensation, in contemplating this aspect of a great question. Within touch of our large industrial centres the number of comparatively small gardens has increased by leaps and bounds, and cultured taste generally directs the disposition, laying out, and planting of them.

Great ruins, in the way of grand old gardens on the down grade have, in a measure, paved the way to greater glories in the number of smaller but beautifully kept expositions of taste and skill. Needless to say, the bulk of these are not show places in the usual acceptation of the term, and can never quite take the place in the horticultural world of the garden of many acres and many men. Nor do the head gardeners themselves fill the same niche in the temple of Flora and Pomona. In many of these pretty and often picturesque places privacy is so rigidly enforced that our worthy head gardener can only show off his handiwork to his chums by stealth, whereas there are, or were, but few of the high-class gardens to which any man with a right to the style and title of gardener did not carry with it the right of entry. It is well known, if seldom mentioned, that the proprietors of the smaller gardens occupy, as their gardeners do, and as their gardens do also, a different niche in the social edifice, and in saying so there is no reason why any disparagement of the trinity should be inferred. These employers, as a rule are smart men, and smart masters make smart servants. They are seldom at home during the early part of the day, but when they do arrive bring with them a balance of those electrical conditions of vitality which the Stock Exchange or directors' board room fails to absorb; hence the head gardener or his man, or men, are generally prepared to finish up their day's work pretty lively when the "boss," refreshed by his cup of tea, comes out to inspect or help as the case may be.

What the employer wants in gardening knowledge is usually made up for—more than made up for—in his ability to make things "hum," and his gardener requires a good deal of tact as well as push to keep things running smoothly. Many a man having occupied a high position

Macdonald &amp; Co. Menzies, Ltd.

Exterior, Philiphaugh Conservatory. See page 464.

in the gardening world finds himself "out," and rather than remain so, in taking up one of these positions is like the proverbial square peg in the round hole—unless his good sense and adaptability prompt him to fit as well as fill the changed position. Then, if he really endeavours to please the employer as well as himself things probably turn out very happily and comfortably for him. Severely exact, and intensely practical in the matter of time and money as the gardener's employer in Suburbia undoubtedly is, a good deal of helpful sympathy oozes out towards a loyal honest, and capable servant, and many who in their earlier tenure of office find nothing but a stern, exacting master are, as occasion serves, made aware that they have a sincere and just friend. Here, on the smaller scale, some of the finest examples of culture are to be found, the outcome of that keen but quiescent competition which is perpetually prompted by the employers to have things not only as good, but a little better, or bigger, or brighter than their neighbours; and the man in charge must be well prepared to hear a good deal of critical adjudication which goes on in the Stock Exchange, as well as other men's methods, with minute details of soil, manure, and situations.

In this class of garden there is considerably less margin for failures than in those of the higher order. Master and man, conjointly, are apt to worry out the cause of any particular failure with fruit, flowers, or vegetables with indefatigable pertinacity, and in these middle grade gardens high grade culture is often carried out to the extent of proving a revelation to many front rank gardeners when they do have an opportunity of seeing it. In latter days the big firms' travellers often find their whole battery of persuasive eloquence and diplomacy powerless to extract the big orders they were wont to do in times of yore, and gladly turn to the smaller places in which, as a smart young commercial said, there is salvation for them. And perhaps it is not saying too much in this slight understudy of the ebb and flow of gardening that they form now the backbone of English horticulture.—Quiz.

heavy work, such as threshing. Under these circumstances horse power, water, electricity, oil, or steam are to be preferred. On lower parts of the country, many estates are very badly supplied with water. It is only in exceptional cases that a supply is not available on some part of the farm or estate, but it often happens that the house, farm, or land which it is desired to supply is at a higher level.

The windmill is the ideal power for this kind of work, and, according to the recent trials of the Royal Agricultural Society of England, there are several makers who supply these of a class suitable for a wide variety of circumstances and of a thoroughly reliable nature. For pumping water one prime requisite is necessary if satisfactory results are to be obtained. That is the provision of a storage tank of suitable capacity to meet the requirements of the case for about fourteen days. The meteorological observations made in this country indicate that certain periods of dead calm are occasionally experienced, extending up to fourteen days, so that where the supply is for household purpose the storage capacity should not be much less than that amount. This may be carried out in many ways, but in the country, where there often is some hill or piece of land higher than the building to be supplied, it should be taken advantage of. A tank of brick and cement should be constructed on or in this height, and the water pumped into it continuously, the supply being conveyed by gravitation wherever wanted.—("Scottish Field.")

## Hybridising and Crossing Plants.

Hybridisation cannot be called new. It is, perhaps, impossible to discover who first practised it. Is it too much to suppose that, in bygone centuries, when, especially in the East, sages became well acquainted with the habits of insects, and found them a source of telling imagery, when farmers tended vast flocks and herds, and cultivated wide tracts of corn, some one might have come to understand the mechanism by which the full corn in the ear is secured, might even have gone so far as to imitate Nature, and obtain new varieties of the plants. It would seem that Theophrastus perceived the efficacy of dusting the fruit-bearing flower of the Palm with the powder

## The Windmill.

In our country, where wind is so prevalent, it is a wonder that these motors have not been taken more advantage of. Here water has been used to probably a greater extent on the average garden or farm than in any country, and that very likely in great part accounts for it. There is, however, plenty of room for both powers. In the hilly districts, where the rainfall is abundant and a sufficient fall is easily obtained, water power will long remain a first favourite. In the drier and flatter districts wind might often be more utilised than it is. For garden, nursery, or light farm work, such as pumping water, where one or two weeks' work can be done at a time when the weather is suitable, it is questionable if it can be done so cheaply by any other power. For work which has to be done daily, such as root pulping or slicing, they are unsuitable, and the same applies to very

produced by the other kind of flower. Towards the end of the seventeenth century, Grew, an Englishman, indicated the probability of the anthers being the organs which furnished the means of fertilisation; and before its close, Camerarius, a German, carried out experiments, and demonstrated clearly the existence of the reproductive organs of plants. Unfortunately, he thought that all hermaphrodite flowers were self-fertilising. He seems to have been the first to suggest the possibility of plant-hybridisation. The first hybrid plant we have any distinct record of was raised by Thomas Fairchild, an English gardener, it being the result of the crossing of two species of *Dianthus*, and named Fairchild's Sweet William.

The science of hybridisation was first put on a proper footing by Kölreuter, who published a work on the subject in 1761. Before the century ended, Knight, after having experimented in rearing domestic animals, set about crossing fruit trees, Strawberries, Peas, &c., so as to find whether better kinds could not be got. Knight was a plant-physiologist of great note, and he propounded the doctrine that "no plant self-fertilises itself for a perpetuity of generations." At the beginning of the nineteenth century Knight was joined by Herbert in the work of producing garden plants, and during that century an immense amount of work, both scientific and economic, has been done. We need only mention the name of Darwin in this connection. He extended Knight's doctrine by adding, "that a cross with another individual is occasionally—perhaps at very long intervals—indispensable."

The earlier records, and indeed the great majority of the records, all along refer to garden hybrids, not to farm ones. This is explained by the fact that in gardening a far greater variety of plants is cultivated, and also by this, that a gardener's training is such as to be much more likely to lead to experimentation in crossing plants than a farmer's is. The gardener deals with plants alone; the farmer has his stock to consider as well. The hybridist should be prepared to carry out the most delicate operations; he should understand the fine details of pot culture; he should come to think of his plants as his pets, and be led to tend them by something after the nature of that poetic instinct which tells us "how akin they are to human things." He is fortunate if he be possessed of a disciplined imagination, a scientific spirit, and a refined touch. Above all, he must be endowed with the maximum of patience.

in purely economic lines the list of workers is already a large one, and it is being added to at the present time at an almost alarming rate

A fortnight ago an International Conference on Plant Breeding was held in New York, at which fifty papers, by forty-eight authors, were submitted. England was represented by three authors, Scotland by one, Ireland one, Canada two, West Indies one, France one, Austria one, and Holland one, all the rest being from the United States. The U.S. Department of Agriculture and the State experiment stations were strongly represented. While many circumstances tell against the proportion of "foreigners" being larger, it is evident that the American has now come to regard the breeding of plants as a matter of the very highest consequence. One is led to think of the princely endowments of most of

the experimental stations connected with the American universities, and one naturally associates the progress made in them with the salaries given to the workers. It is neither the place, nor the salary, but the man we must look to after all. If improvement of crops is called for in a new country, how much greater is the need in an old country?

By way of illustrating what is being done in the United States, I may mention that during a recent tour there I visited one of the most noted of American workers, Professor Willet Hays, the head of the agricultural experiment station of the University of Minnesota. He is well known as the raiser of Wheats which are expected to double the harvest in Minnesota and neighbouring States. Another famous hybridist visited was Mr. Luther Burbank of Santa Rosa, California. His work is chiefly among fruits and flowers, but he is well known as the raiser of the Burbank Potato. One of his most interesting and useful "creations" was the "Plumcot," a cross between the Plum and the Apricot.

Passing to personal experiences, it may not be inappropriate to mention that I worked for a very considerable number of years accumulating a mass of material of scientific interest, which, for want of time, has not been elaborated. The varieties of plants produced were of but little commercial use. On being appointed to the lectureship in agriculture in St. Andrew's University, I turned to farm plants, and what is now to be said of them is virtually the outcome of two summers of experimentation at St. Andrews. It is well to state that the work has been hitherto carried on at the lecturer's own initiative and expense. In St. Andrew's University it is no uncommon thing to find enthusiasm leading to a little self-sacrifice. Endowment is a secondary consideration in a place where the teachers feel themselves to be, if not the heirs of all the ages, of, at any rate, 500 years of educational progress.

The methods of work are simple enough. A few plants of each kind only are required. These are allowed to flower, protected if necessary, and operated on in the usual way. I consider a glazed case of my own invention to be the best means of protection. There are two classes of flowers to be dealt with, those which are fertilised by insect agency, and those which are self-fertilised. Amongst the former are classed Turnips, Cabbages, and the like, and among the latter the cereals and grasses. One of the most interesting points in connection with

Interior, Philiphaugh Conservatory. See page 464.

the Turnip family is this, that the flower of the Swede is virtually identical with that of the Cabbage and its cultivated varieties; while the flower of the yellow or common Turnip is quite different from both. It is comparatively easy to manipulate Turnip flowers so as to secure crosses. It must be remembered that although flying insects are excluded, the plants often set seed by self-fertilisation. In this connection, however, one should notice that the flowers of Crucifers are commonly infested with small beetles, which creep about in quest of pollen, and it is possible that now and again they may carry it from one flower to another. In the plots one can see at present growing examples of crossed Swedes and Turnips, and reciprocal crosses between these. The pollen parent seems in many cases to be prepotent. Intermediate vegetative characters are often displayed.

An elaborate series of crosses in the genus *Brassica* has been gone into, and the crossing together of the cultivated derivatives of the original Cabbage, viz., Brussels Sprouts, Broccoli, &c., has yielded very interesting results. Very evident intermediates have been got between Brussels Sprouts as the seed parent and Curled Kale, Broccoli, and Savoy as the respective pollen parents, and so on, in some sixteen combinations. It is hoped that some of the new vegetables may prove useful. Efforts to cross Swedes and Turnips with the above seem to have resulted in total failures. An unusually interesting hybrid has been obtained from pollination of Curled Kale by Charlock. There are four plants, and they all bear marked resemblance to Charlock. They are, however, of taller growth, the tallest flower shoots being over 5ft. Although they flower profusely, they refuse to bear seed. An examination of the pollen shows that it is extremely inferior.

The crossing of Potatoes is rendered difficult chiefly through the want of normal flowers. Some varieties do not flower at all; others more or less, but bear no fruit; while only a few bear fruit freely. In a field of British Queen, covered with bloom, fruits were found only where crossing had been carried out. The pollen is often very deficient. A variety from New Zealand has proved to be useful, being successful both as a seed and pollen parent. The crossed seed was kept until spring, and was then sown in slight heat. The young plants were grown for a time in pots, and then planted out. Most of the seedlings have done well. Sown on March 12, and planted out on June 6, the first flower opened on July 19. The shaws (haulms) have in many cases been very strong, often over 3ft in length, and in one instance no less than 5ft. The few examples yet lifted show a very fair crop, over 5lb to one plant being noted. The tubers are often well up to average size, some illustrated being

4in to 5in in length. A remarkable result is noted when the tubers of one parent are red and the other white. Many of the tubers of the cross are purple and white, but few red. The colour of the flowers was found to correspond almost invariably in a general way with the colours of the tubers—purple with purple, white with white.—D. J. WILSON, St. Andrew's University, at the opening of the West of Scotland Agricultural College, October, 1902.

## The Priory, Leamington, Warwickshire.

TRAVELLING from Leamington to Warwick on the Great Western Railway, the outlook on the left, just before reaching Warwick Station, is one of considerable beauty, as a glimpse can be obtained of the ancient town of the "King Maker," with its picturesque "gates" and the commanding tower of St. Mary's Church. More stately and imposing, however, than all else around, are the grand old towers of the Castle, which rise from their once watery base above the tree-tops on either side—trees which, though of giant stature, are but as babies in point of age when compared with the grey walls they help to adorn.

Just beyond Warwick Station, on the crest of a hill, a mass of tall trees again arrests attention, and the casual observer would perhaps scarcely notice, through the slight openings between them, evidences of an old and extensive building; yet in that secluded spot, shut off from the town on the opposite side by a high wall, is the "Priory," probably as old as almost any part of Warwick save the Castle. The mansion, gardens, and grounds which surround it are extensive, and yet half the inhabitants of the town have not the slightest idea of the size of the domain, because of the encircling belt of trees. The principal entrance is through massive iron gates at the top of Northgate Street; from that point the drive sweeps onward with an easy curve to a courtyard, and thence to the stately entrance to the mansion, the inside of which it is not within my province to describe; but one could not help noticing the quaint sundial over the door, and the telling motto beneath, which reads thus:

I mark the moments,  
Both for good and ill.

The Priory has only been in the occupation of R. Emmet, Esq., about eighteen months, and as during that time the glass houses have undergone extensive repairs, very little room could be found for bedding plants. The flower garden has therefore

Mackenzie and Menzies, Ltd.

Exterior, Farmleigh Conservatory. See note on page 464.

Mackenzie and Macdonald, Ltd.

**Interior, Farmleigh Conservatory.** See note on page 464.

been planted principally with annuals, and in the geometrical beds on grass, Stocks have been exclusively employed, and right well have they answered the purpose for which they were intended by giving hosts of fine spikes of showy and sweetly scented flowers throughout the season; a fine white variety, named "Christmas Tree," has been especially good. Near by are grand beds of Rhododendrons and Azaleas, which must have been brilliant pictures at their flowering time. Coniferæ seem here to have found a congenial home, for splendid specimens may be seen on every hand.

And now I come to one of the great features of the gardens and grounds which must impress all visitors, especially those who delight in styles of olden times—viz., the Yew hedges. I have travelled a bit, and have seen many of the best of British gardens, but nowhere have I previously encountered such an imposing array of beautifully kept Yew hedges.

Here there are gardens enclosed with Yew hedges, gardens divided with such hedges, walks bounded with Yew hedges, and walls faced with hedges; Yew hedges, in fact, everywhere. They certainly create a feature which carries us back to the gardens of olden days; but, oh! the work they give. For six long months of the year one man and his helper are constantly employed in clipping them into their rigid shape. What a sum total of useful labour this would represent if spent in more productive gardening. But away with such thoughts, for the labour is well spent in preserving the distinctive character of such old-world gardens. As in many other ancient gardens, the vegetable quarters here are not arranged in the form of one large kitchen garden, but vegetables are grown in several enclosures. So much the worse for the gardener, because of the extra labour it entails.

In order to keep pace with the demand, the utmost has to be made of every inch of space, and therefore as soon as one crop is cleared another takes its place. It is not necessary to enumerate the many species or number of vegetables grown, they are similar to those cultivated in other large establishments in order to keep up a continuous supply throughout the year. A special note must, however, be made of grand breadths of Sutton's Matchless Brussels Sprouts, and Major Clarke's Red Celery. The former is the best example of "Sprout" culture I have seen this season, the huge stalks, three or four feet in length, being studded with hard round knobs, which are the true test of good culture. Early planting,

firm soil, and allowing plenty of space for each plant, are the details which have brought success.

A special feature is also made of herbs and vegetables for making salads. Among the many varieties of Peas grown Sutton's Windsor Castle, has proved the most prolific and satisfactory in every way, the quality being of the highest order.

The fruit crop in the open air—as in many other gardens—has been almost a failure, but in a cool Peach house, healthy trees were carrying fine crops which are greatly valued. The other glass houses are devoted principally to the production of plants and cut flowers, for which there is an increasing demand. A grand batch of Begonia Gloire de Lorraine will undoubtedly be of special value during the autumn and winter months; there must have been fully 200 plants in 5in, 6in and 7in pots, each one being perfectly clean, and a model of good culture. Late struck cuttings also supply hosts of "baby" plants in thumb pots just suitable for carrying out the lighter parts of dinner-table decoration. Palms, large and small, Ferns, Chrysanthemums, Carnations, Begonias, Gloxinias, and highly-coloured Dracænas and Crotons, are largely grown in pots of the right size for decorative purposes.

A good collection of Orchids is also being got together, and already the collection contains several very fine specimens of Cymbidiums, Cattleyas, and Cypripediums, and the Odontoglossums are a remarkably clean healthy lot. The favourite Tomatoes are Dobbie's Champion and Perfection, a good batch is grown in pots, in the open air, ready for placing under glass in October to supply fruits during the autumn months. Many of the best modern varieties of Strawberries are grown, and on September 21st I noticed among them that fine late variety, St. Antoine, carrying really good ripe fruits. I can confidently recommend this variety for autumn fruiting.

Mr. H. Sinclair, the energetic head gardener, who took charge of the above gardens a little more than a year ago, is a young man, who should make his mark in the gardening world, if energy and close attention to duty will achieve distinction. He is an old and constant reader of the *Journal of Horticulture*, and his good training in such well-known gardens as Eaton Hall and Barford Hill have well fitted him for his present post, where his employers take the greatest interest in all matters connected with the gardens around their English home—a home in the heart of the Midlands, yet ancient and secluded as a forest in the days of Robin Hood.—WANDERER.

## Societies.

### R.H.S. Scientific Committee, Nov. 10th.

Present: Dr. M. T. Masters, F.R.S. (in the chair); Messrs. Odell, Veitch, Saunders, Worsdell, Masee, Chittenden, Bowles, Holmes, and Baker; Dr. M. C. Cooke; Professor Boulger; Revs. W. Wilks and G. Henslow, Hon. Sec.

*Scientific investigations at Wisley.*—In reply to Dr. Masters' request for suggestions, Mr. F. J. Baker wrote to say that in his opinion the botanical director should have a sound practical knowledge of general science (including biology, chemistry, and physics), and a sufficiently good knowledge of gardening to enable him to apply facts to such intricate problems as arise in connection with horticulture. He should be able to distinguish between the requirements of artistic, scientific, and economic gardening. Mr. Baker also made suggestions of a pecuniary nature. Dr. Rendle in his communication discusses the question of expense and necessary appliances for the Director, e.g., microscope, apparatus &c.

*Potatoes and Millipedes.*—Mr. Chittenden showed Potatoes badly attacked by these creatures. It was thought that an excess of manure and a deficiency of lime favoured their presence.

*Crocus new to cultivation.*—Mr. Bowles exhibited some growing plants of interesting species as follows:—*C. Cambessedesi*, Gay, introduced to cultivation by Mr. G. Maw, but subsequently lost. It is now re-introduced from Port Mahon in Minorca. It only occurs in Majorca and Minorca. *C. caspius*, Tisch and Meyer. This species is new to cultivation. It was collected in Russian Talych at an elevation of 1,000ft. *C. c. var. lilacinus* has flowers of a pale rosy lilac colour; the throat, as of the type, is of a bright yellow colour. A unanimous vote of thanks, proposed by Mr. Veitch and seconded by Mr. Holmes, was given to Mr. Bowles with Botanical Certificates for the new species exhibited.

*Pears malformed.*—Some curious specimens were received from Mr. Goodacre, Elvaston. Professor Henslow examined them and reports as follows:—The stalk of the fruit had made a preliminary effort to form a Pear, but only on one side of it; thereby producing a curved, somewhat pointed, wen-like excrescence, due to the hypertrophy of the cortical tissues. This caused a curvature in the stalk; from out of this depression the stalk continues its growth, finally terminating in an elongated Pear. The core or carpels, when present, for they were in some instances suppressed, were situated very close to the terminal depression which contained the calyx and other remnants of the flower.

*Fraxinella capsules.*—Dr. Masters showed specimens, illustrating the peculiar way the endocarp separates from the outer wall of each follicle. Then, by twisting, it jerks the seeds out. It was again remarked that the seeds must not be allowed to dry lest they fail to germinate.

### Devizes (Wilts), November 3rd.

This is annually held in connection with a very deserving institution, the Devizes Benevolent Society, and one half of the Corn Exchange was filled with groups of Chrysanthemums and fine blooms, and the other half with gaily-decorated stalls, at which ladies sold various articles in aid of the Society. But the Chrysanthemum show is always a great attraction. It was admirably arranged by Mr. W. King, of the Castle Gardens.

Two bold groups were staged in the centre, the first prize for one arranged in a circle with foliaged plants went to Mr. H. Clack, gardener to G. E. Colston, Esq., M.P., Roundhay Park, Devizes. Miss Niven, the Grange, Marden, took the second prize. A class for twenty-four blooms of incurved and twenty-four of Japs, shown in combination, is always a very interesting one, and the first prize fell to the lot of Mr. W. Higgs, gardener to J. B. Hankey Esq., Fetcham Park, Leatherhead, with, as might be expected, excellent blooms throughout. The King is a promising new variety of a rich lake tint. Two other prizes were awarded. Mr. Drake, of Cardiff, who had entered for this class, had a serious accident to his blooms through careless handling, and could not exhibit. He had some excellent incurved varieties. With twenty-four blooms of Japs, Mr. F. S. Vallis, Bromham, Chippenham, won the Mayor's handsome silver cup. He had finely-developed examples of Sensation, F. S. Vallis, E. Molyneux (in excellent character), Brightness (bright rose, one of Mr. H. Silsbury's raising, and very fine), Mildred Ware, Bessie Godfrey, Monsieur Viger, S. T. Wright, W. R. Church, Valerie Greenham, Mdm. Herrewége, Mrs. Bryant, Nellie Pockett, Henry Stowe, Chas. Longley, &c. Second, Mr. C. J. Salter, gardener to Mrs. Haywood, Woodhatch, Reigate, who had fine blooms of Mrs. J. Lewis, E. Bettesworth, W. R. Church (very fine), W. Duckham, Mrs. G. Mileham, Mildred Ware, W. A. Etherington, Chas. Penford, Mary Inglis, General Hutton, F. S. Vallis, &c. Mr. F. Cooke, gardener to T. E. Taylor, Esq., was third with twelve blooms of Japanese incurved. Mr. F. Bible, The Gardens, Draycott, Chippenham, was first. Chief among his blooms were Mrs. Mileham, Captain P. Scott, Godfrey's Masterpiece, Miss Mileham, Mdm. P. Radaelli,

Florence Molyneux, &c. Second, Mr. F. S. Vallis, with twelve blooms of Japs, six white and six yellow. Mr. H. Wright, Beckett Gardens, Shrivenham, was first; he had six blooms each of F. S. Vallis and Miss A. Byron. Mr. Vallis came second with Bessie Godfrey, F. S. Vallis, and two whites, Mrs. J. Lewis and Mdm. Herrewége. Mr. H. Clack was third. Mr. H. Clack was placed first with twelve Japanese, open only to exhibitors in Wilts. The best epergne of Chrysanthemums was staged by Mrs. Lucas, and Miss Vallis was second; but Miss Vallis came first with a charming basket of autumn foliage, Mr. Lucas taking the second prize.

### Cheltenham (Gloucestershire), November 4th.

There is a happy combination of horticulture and agriculture at Cheltenham, and on this occasion the spacious Winter Garden was seen to be filled with very much of the produce of the garden and a great deal from the farm. The brilliant Chrysanthemums predominated. There were very fine and effective circular groups, somewhat too formal and too much packed; but yet effective in the case of the large groups. Mr. J. Horlick (J. Maddocks, gardener) 1st, for largest Mr. H. O. Lord (T. May, gardener) was a good second. In another class for a group Mr. Horlick was again awarded a first prize. There was still a third group, in which Mr. Leighton, an amateur, took the first prize, staging remarkably good stuff.

Specimen plants were in several classes, but they were not so good generally as we have been in the habit of seeing them at Cheltenham. The Japs were decidedly the best. An excellent specimen of W. R. Church was in the first-prize collection of six plants.

The greatest interest centred in the cut bloom classes. The best eighteen incurved came from the Misses Davies (H. J. Driver, gardener), whose blooms, generally well-finished, comprised M. A. Haggas, Mdm. Ferlat, Princess of Wales, Hanwell Glory, Fred Palmer, C. H. Curtis, Violet Tomlin, Major Bonaffon, &c. Mr. H. O. Lord was a good second. In the class for twelve blooms, Mr. E. Hadland (E. C. Young, gardener) was well in first. He had, in good condition, Topaze Orientale, Pearl Palace, Miss A. Hills, Mrs. Crooks, C. H. Curtis, Mdm. Ferlat, &c. Major Showell (J. Mallow, gardener) was second.

Japanese blooms were finely shown by Mr. Horlick, whose leading varieties were J. R. Upton, Kimberley, Mrs. Mease, Mafeking Hero, Miss E. Fulton, Mrs. G. Mileham, Duchess of Sutherland, W. R. Church, J. T. Thorneycroft, Mdm. P. Radaelli, Le Grand Dragon, &c. Second, Mrs. Swinburne (Mr. Martin, gardener), who also had finely-developed blooms. In the class for twelve Japs Sir Hubert Parry, Bart. (Mr. Berry, gardener) was placed first, having, in fine form, Lord Salisbury, Mrs. Barkley, J. R. Upton, Chas. Longley, Miss L. Mountford, Kimberley, Eva Knowles, &c. Major Showell was a close second. There was a class for six varieties also.

A new class for twelve vases of large specimen blooms, three blooms of one variety, to be shown in a vase, was instituted for the first time, and brought an excellent competition: Mr. H. O. Lord was first, and Mr. J. Horlick was second.

Plants were represented by some glorious examples of Begonia Gloire de Lorraine, by Cyclamens, Primula sinensis, Violas, Salvia splendens, &c., all very creditable.

Fruit was represented by fairly good black and white Grapes; culinary and dessert Apples, owing to the season and their scarcity, fell below the usual mark; and of Pears there were none, excepting some big Pitmaston Duchess and Belle d'Angvine, shown for weight. A few Pears were among the collections of hardy fruits, which consisted mainly of Apples.

Vegetables were numerous shown, and some good collections were staged in competition for the special prizes offered by Messrs. Sutton and Sons and Yates and Son.

Much that interested the agricultural interest were also good and of varied character. The arrangements made by Mr. Sharpe, the secretary, were, as usual, excellent, and satisfactory all round.

### Ipswich and East of England Horticultural.

This Society held its annual Chrysanthemum show in the Public Hall, Ipswich, on November 10 and 11. Generally speaking, the display was of a very satisfactory character, and competition was keen throughout. Show boards have been all but abolished at this exhibition, only one or two classes being reserved for blooms shown in this manner.

**CUT FLOWERS: CHRYSANTHEMUMS.**—The principal class for Japanese is that for six vases, five blooms of each variety. This brought only one competitor, Mr. T. Whittel, gardener to Luther Holden, Esq., Rushmere, who was awarded first prize for nice set, comprising W. R. Church, Mrs. G. Mileham (good), Matthew Smith, Mrs. Mease, T. Carrington, and Mrs. Greenfield. For eighteen Japs, in six vases, competition was keen. Mr. W. Messenger, gardener to C. H. Berners, Esq., Wolverstone, secured the premier award with a highly coloured exhibit

which comprised J. R. Upton, W. R. Church, Mrs. E. Thirkell, Mrs. G. W. Palmer, Mrs. E. Hummel, Le Grand Dragon, M. Louis Remy, Miss Elsie Fulton, Mrs. R. Darby, Lily Mountford, Vivian Morel, F. W. Vallis, Mrs. Barkes, Bessie Godfrey, Chas. Longley, Miss E. Pilkington, Sensation, and G. Penford. Mr. A. Creek, gardener to Sir C. Domville, Bart., The Chantry, Ipswich, was not far behind, his best flowers being Miss Lucy Evans, Miss A. Byron, Mrs. E. Thirkell, and Mrs. Mease. Both exhibits were deficient in white varieties. Mr. J. Clark, gardener to Mrs. Spooner, Rushmere, was third.

Mr. A. Haynes, gardener to Col. Browning, C.B., Brantham Court, Manningtree, staged an excellent stand of twelve Japs, and secured the premier award, the varieties being Gen. Hutton, Lord Salisbury, Princess de Brancovan, W. R. Church, Mrs. Barkley, Lord Ludlow, Mr. T. Carrington, Edith Tabor, Miss Alice Byron, J. R. Upton, Mdme. Carnot, and Godfrey's King. Mr. A. Creek was second, having nice blooms of Mrs. Mease, Calvat's Sun, Gen. Hutton, and Miss Lucy Evans. For six white Japs in a vase, Mr. H. H. Godbold, Ipswich, was first with Mdme. Carnot; Mr. Haynes second with Mdme. Phillippe Rivoire. In the corresponding class for any other colour, Mr. Godbold was again successful with a lovely set of Bessie Godfrey; Mr. Creek second with Mrs. Mease.

A pretty show was made by the class for six large blooms, arranged in a vase with autumn foliage. Mr. W. Messenger was placed first, having fronds of Osmunda, Maple leaves, and other coloured foliage. This vase contained the premier bloom in the open classes, Bessie Godfrey. Mr. Godbold was second.

In the amateur classes competition was remarkably keen, and some good flowers were staged. Mention must be made of the four vases of Japs, three of each, staged by Mr. Haynes, which consisted of Mrs. J. Lewis (enormous flowers, one being selected as the premier bloom in the amateur classes), Mrs. E. Thirkell, W. R. Church, and Mrs. Barkley. Cut flowers of decorative Chrysanthemums in vases were largely staged, but were hardly up to the average in quality.

**PLANTS.**—For a circular group of miscellaneous plants, Mr. A. Creek easily outdistanced all other competitors. The centre was composed of tall Grevilleas, large-flowered Chrysanthemums, and fine specimen Crotons, while the circumference consisted of groups of Calanthe Veitchi, C. vestita, Begonia Gloire de Lorraine, and Carnation Mrs. Lawson. Mr. R. C. Notcutt, Broughton Road Nursery, Ipswich, was second with an arrangement of Palms, Chrysanthemums, Ericas, and Bouvardias. Classes for Primulas, Poinsettias, Begonia Gloire de Lorraine, &c., were exceedingly well filled. Table decorations are a new departure, and seemed to be amply justified. In the open class, Mrs. Messenger was placed first, with a charming arrangement of Begonia Turnford Hall and Princess of Wales Violets, with Asparagus decumbens and other foliage. Mrs. Shipman, Norfolk house, Woodbridge, second; using Begonia Gloire de Lorraine and Lily of the Valley, in conjunction with Smilax and Maidenhair. The third prize went to Mr. A. Andrews, High House Gardens, Campsea Ashe, who used Oncidium varicosum O. Rogersi, and Cypripedium.

**VIOLETS.**—In competition for the special prizes offered by the Rev. A. Foster-Melliar, and likewise for those offered by the Society, many grand exhibits were staged; indeed, it is doubtful whether the display could be beaten or even equalled at any other show in the country. For six bunches, in three varieties, arranged with own foliage, Mr. Andrews was placed first with Marie Louise, De Parme, and Princess of Wales. Mr. A. Creek was a close second with Marie Louise, De Parme, and Comte de Brazza. For a bunch of any single, Mrs. Godfrey Hempson was easily first with some grand flowers of La France; Miss G. Foster-Melliar second with Princess of Wales. For any double variety, Mr. Andrews scored with very fine Marie Louise, Mr. Whittel being second with the same variety. Mr. Whittel was first for a spray and buttonhole of Violets, with Marie Louise arranged with Maidenhair Fern; Mr. O. G. Orpen, West Bergholt, second with a single variety; Mr. Creek third with Comte de Brazza and Mrs. Astor, arranged with own foliage and Asparagus.

**FRUIT.**—With the exception of Pears (of which only eight dishes were staged) there was a good show. For Alicante Grapes Mr. W. Messenger was first with large, well-coloured bunches. Mr. E. Creek, gardener to A. Fraser, Esq., Westerfield House, Ipswich, was second with nice shaped bunches, rather small in berry; third, Mr. A. Andrews. Any other black Grape, first, Mr. T. King, with Mrs. Pince; second, Mr. W. Messenger, with Gros Colman; third, Mr. Andrews, with Lady Downe's. For Muscats, Mr. Andrews scored with well-finished bunches, Mr. A. Creek second, and Mr. E. Creek third. Any other white variety, Mr. W. Messenger first, with Lady Hutt (only entry). Apples, both dessert and cooking varieties, were well represented considering the adverse season. The principal prize-winners were Mr. O. G. Orpen, Mr. S. W. Sweet, Mr. John Wolton, and Mr. Andrews. Vegetables, as usual, were of excellent quality, but, unfortunately, the small size of the hall causes them to be relegated to a draughty corridor, where inspection is anything but pleasant.—E. C.

## Winchester (Hants), November 11th.

In the Guildhall the annual show was held, and was a success, in spite of the fact that there were fewer entries in the cut bloom classes. Nowhere is an autumn show better managed than this. The hall seems to lend itself to a display of that character with the long lines of tables running the length of the hall, flanked on each side with the Chrysanthemum groups and specimen plants. A room was set apart mainly for the classes devoted to ladies in the gentle art of arranging flowers for various purposes. Fruit and vegetables were a feature, especially the Grapes, which were numerous and good. Plants are usually seen here in good condition.

For a group of Chrysanthemums (8ft by 7ft), quality of blooms to be the leading feature, substantial prizes were offered, and brought three good exhibits, Mr. H. G. Pitteman, gardener to Mrs. Curtis, Oakwood, Otterbourne, being first. He had dwarf plants, well furnished with high quality blooms, many of them belonging to the incurved section. Mr. Pearce, gardener to H. E. Johnson, Esq., Northgate Place, Winchester, was a good second. Mr. R. Stone, gardener to the Ven. Archdeacon Haigh, The Close, Winchester, third.

For nine plants suitable for conservatory decoration, Mr. G. Adams, gardener to Col. Dickins, Edgell, Winchester, was first. Mr. H. Gigg, gardener to the Rev. D. M. Moorson, Holyrood, Winchester, second. The same exhibitors occupied a similar position in the class for nine plants, white or yellow.

Miscellaneous plants arranged for effect were an interesting feature. Mr. E. Long, gardener to F. C. Burch, Esq., Winchester, with a grand batch of Orchids, suitable greenery, and science of arrangement, easily secured the first prize. Primulas, Cyclamens, table plants, and Lorraine Begonias were well represented.

Cut blooms were a trifle fewer in number, but the quality was quite up to the average. In the leading class, for forty-eight Japs and incurveds, there was but one entry, that from Mr. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester. The quality usually obtained by this exhibitor was well maintained on this occasion. For thirty-six Japs in twenty-four vars., Mr. J. Wasley, gardener to J. B. Taylor, Esq., Sheffield Manor, Basingstoke, was easily first with high class blooms, correctly staged. Especially noticeable were Mrs. H. Emmerton, Madame Carnot, J. C. Neville, Mrs. G. Lawrence, Edwin Molyneux, Matthew Smith, C. Penfold, Mrs. J. Cleeve, Mary Perkins, Queen Alexandra, Sensation, Mrs. R. Darby, W. R. Church, Mrs. E. Hummel, Elsie Fulton, Kimberley, and J. R. Upton. Mr. Neville was a good second. In a class for twelve Japs Mr. Dawes, of Hambledon, was easily first with high class blooms. Mr. R. J. Ransom, Elm Lodge, Bishop Sutton, second. Mr. A. J. Marsh, Morton House, Winchester, was distinctly ahead for twelve Japanese in not less than eight varieties, with richly coloured blossoms of F. S. Vallis, Mafeking Hero, Sensation, M. Louis Remy, W. R. Church, and Mildred Ware. Mr. F. Smith, The Close, Winchester, second.

Japanese, staged in vases, were, as they usually are, an attraction. For nine varieties, three blooms of each, Mr. Wasley won the premier award; Mr. Neville second. For six, under similar conditions, Mr. A. J. Marsh won, and Mr. G. Adams second. Mr. F. Smith third. Amateurs staged exceedingly fine blooms. Mr. E. Jarrow, 38, North Walls, Winchester, was distinctly ahead with superb blooms of leading varieties.

Fruit was excellent, especially the Grapes. For three bunches, distinct varieties, Mr. W. Mitchell, gardener to J. Willis Fleming, Esq., Chilworth Manor, Romsey, was first with Mrs. Pince in superb condition, Muscat of Alexandria, and Alicante. Mr. Wasley second. Mr. J. Hughes, Twyford Lodge, third. Mr. Wasley, with exceedingly fine examples of Muscat of Alexandria won first place for two bunches any colour. Mr. Mitchell, with Mrs. Pince (barely finished), second. Apples and Pears were few in number, but good in point of quality.

Vegetables were numerous and good. In the classes for six dishes Mr. Ellwood, gardener to W. H. Myers, Esq., M.P., Swanmore House, Bishop's Waltham, secured the premier award in both Messrs. Sutton's and Toogood's classes with produce difficult to improve upon. Mr. Best, gardener to F. R. Leyland, Esq., The Vyne, Basingstoke, second.

The society's gold medal was awarded to Messrs. E. Hillier and Son, Winchester, for a grand display of Apples. Mr. E. Ladham had a grand and surprising show of Gaillardias, herbaceous Lobelias (newer types), &c. Mr. Neville staged six dozen blooms of incurved Chrysanthemums of leading sorts, all in the pink of condition. To these the N.C.S. certificate of merit was awarded. Messrs. Toogood and Sons had a huge exhibit of Potatoes, Onions, &c.

## Liverpool, November 11th and 12th.

For something like twenty-two years the handsome St. George's Hall has been available for the Chrysanthemum and Fruit Show; but owing to the hall having been previously bespoken, the Drill Hall, Botanic Road, was requisitioned. As

to the financial part of the business, one cannot give a glowing account: still, all who attended evidently came away with the pleasure of knowing that they had seen a good exhibition.

In cut blooms Liverpool has always been in the forefront, and with the redoubtable champion, Mr. J. Heaton, leaving the neighbourhood, excitement ran high as to who would secure the association's grand challenge cup, with the money prize of ten guineas, for twenty-four Japanese and same number of incurveds, distinct. Six competed, and never have finer blooms been staged. The winner was Mr. E. Ellis, Riverview, Heswall. The following were some of his varieties: Mrs. F. S. Vallis, Duchess of Sutherland, Mafeking Hero, Sensation, Elsie Fulton, Godfrey's Pride, Geo. Lawrence, Mrs. E. Hummel, General Hutton, Nellie Pockett, W. R. Church, Mermaid, Sir H. Kitchen, and Bessie Godfrey. The incurveds were of the well-known kinds. The second prize went to Mr. T. Young, gardener to T. G. Williamson, Esq., Otterspool House, who had Mildred Ware amongst others. Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., Highfield, Woolton, was a splendid third; and Mr. P. Barber, gardener to Walter Holland, Esq., Carnatic Hall, fourth.

Six again competed for eighteen Japs, and here the same quality was noticeable. Mr. C. Jones, gardener to E. Evans, Esq., Spital Old Hall, led with grand blooms of Rev. W. Wilks, W. R. Church, Mrs. F. S. Vallis, Duchess of Sutherland, and Bessie Godfrey. The second went to Mr. P. Greene, gardener to Col. Gee, Greenhill, Allerton, and third to Mr. W. A. Webster, Paul's Moss, Whitechurch. For a similar number of incurveds Col. Gee had an easy victory, with capital flowers. Mr. H. Osborne, Holme Hey, Sefton Park, second. Five competed for twelve Japs, Mr. J. Clarke, Allerton Hall, winning with a very heavy stand. Mr. G. Osborne, Tue Brook House, second. The same exhibitors came in the order named for twelve incurveds. The pompon class was extra good. Mr. E. Wharton, Mavis Court, Sefton Park, won with Prince of Orange, Black Douglas, and Adilia Prisetta in perfection. Mr. Wharton had the best reflexed.

Five entered the lists for six vases of Japanese cut flowers, three blooms in each. Mr. J. Williams, Boscobel, led. Mr. J. Stoney, gardener to F. H. Gossage, Esq., Camp Hill, Woolton, had excellent vases of singles. The same exhibitor broke away from the usual Liverpool bronzy table decorations, but could not win with his pink flowers. Why? Few could tell. Mrs. Vlasto was awarded the prize for an arrangement which caused a certain amount of comment. The baskets, on the other hand, were distinctly improved, Mr. J. Williams having a handsomely arranged one of single and reflexed yellow Chrysanthemums interspersed with Crotons, Smilax, and Asparagus. Plants figured prominently. Mr. F. Keightley, Grassendale, had the best six staked, and Mr. Wharton a decidedly good six naturally grown.

Groups should form a greater attraction in arrangement. Mr. G. Osborne had the best. Mr. G. George, Whitefield House, Roby, second. The plant classes (miscellaneous) were again a great treat. Equally interesting was the brilliant display of Orchids, the victories resting with Messrs. Finch, Carling and Young. The Poinsettia class was perfection, and Bouvardias, too, were encouraging, Mr. T. Hitchman gaining both prizes. The Grape classes brought many entries and beautifully finished specimens. Mr. Skitt, Mr. Reid, Mr. J. Barker, and Mr. Wilson won prizes. Hardy fruit was much below the average.

The trade exhibits were handsome. Messrs. Dicksons, Ltd., Chester, staged a superior table of miscellaneous plants and fruit. Messrs. J. Cowan and Co. had an extra choice table of Orchids. Mr. Jno. Robson, Altrincham, an unusually fine group of winter flowering Carnations. Messrs. Sutton and Sons, an interesting exhibit of their new handsome Potato, "Discovery." Messrs. T. Davies and Co., Wavertree, had tempting Mushrooms, choice Lily of the Valley, and pot Conifers. Messrs. Rowlands and Sons, Childwall Nursery and West Derby, a fine stand of Begonia Gloire de Lorraine, interspersed with Asparagus Sprengeri. Mr. F. Roberts, West Derby, a large table of specimen Chrysanthemum blooms, Maidenhair Fern, and Begonias. Mr. George Rose, sundries. Mr. H. Middlehurst, a long table of the most approved varieties of Potatoes; and lastly, a stand of specialities from the Ichthemie Guano Co., Ipswich.

### Parkstone (Dorset) November 11th and 12th.

This lovely place has often been called the Mentone of England, and few persons can visit it without being charmed by its scenery, with the sea to the south, and nestling amongst the Pine woods, Fern, and Heather-clad hills, it is a most appropriate spot for an autumn floral display. The eleventh annual show was, in every respect, a decided advance upon any of its predecessors. Cut blooms and groups of plants made a fine exhibition in themselves; and considering the naturally sandy soil of the neighbourhood, the quality of the vegetables was exceedingly good. Table decorations, epergnes, baskets, bouquets, and sprays of cut flowers

filled a large annexe to the main building, and tasteful arrangement characterised the whole of the competitive exhibits here, and added considerably to the beauty of a very successful show. Mr. T. K. Ingram, of the Parkstone Nurseries, put up a splendid lot of pink Carnations and Begonia Gloire de Lorraine, which drew admiration from all visitors.

**CUT BLOOMS.**—Twenty-four Japanese, not fewer than eighteen varieties. Mr. G. Hall, gardener to the Dowager Lady Ashburton, Melchett Court, was first with a grand lot, namely, F. S. Vallis (2), Mrs. Mease (2), Marquis V. Venosta (2), General Hutton (2), Mdme. P. Radaelli (2), W. R. Church (2), Mrs. G. Mileham, Bessie Godfrey, Mrs. J. Lewis, C. Penford, Mdme. Carnot, Mrs. T. Carrington, Lord Ludlow, Kimberley, Mrs. Hummel, Mrs. Barkley, and Mr. L. Remy. Second, Mr. W. Green, gardener to the Rev. W. M. Anderson; third, Mr. J. Page, gardener to Mrs. Laymon.

**TWELVE JAPANESE, DISTINCT.**—Mr. G. Hall secured first place again in this class, having fine examples of General Hutton, Marquis V. Venosta, Mrs. J. Lewis, F. S. Vallis, W. R. Church, Mdme. Carnot, Bessie Godfrey, Mrs. Mease, Mdme. P. Radaelli, Le Grand Dragon, Mrs. G. Mileham, and Mrs. Barkley. Second, Mr. W. Green; third, Mr. J. Page. Mr. J. Hobbs, gardener to Mrs. Barrow, was first for twelve Japanese, not fewer than eight varieties; second, Mr. J. Gould, gardener to Mr. L. Dawson Damer; third, Mr. G. W. Palmer, gardener to Mr. F. S. Field. Mr. G. Hall scored again for six Japanese, one variety, with very fine specimens of Mdme. P. Radaelli. In the class for nine cut Japanese on long stems, Mr. J. Hobbs was easily first.

**TWELVE INCURVED, NOT FEWER THAN THREE SORTS.**—Mr. G. Hall was first with fairly good blooms, as follows: Chas. Curtis (2), J. Agate (2), Mr. R. C. Kingston (2), Pearl Palace, Topaze Orientale, Ialine, Miss Haggas, Louise Giles, and F. Palmer; second, Mr. Gould; third, Mr. F. Cuff, gardener to Dr. Horace Smith.

**GROUP OF CHRYSANTHEMUM PLANTS.**—First, Mr. C. Barrett, gardener to Mr. Howard May; second, Mr. W. Palmer; third, Mr. S. Bodger. Mr. S. Horlock had first prize for a collection of eight varieties of vegetables; Miss A. E. Vivian for table decoration; Miss K. Light for epergne; Miss Penreath for basket of cut blooms; and Miss Palmer for sprays. The amateurs' and cottagers' classes were filled with high-class produce.

### Birmingham, November 10th, 11th, and 12th.

A capital Chrysanthemum exhibition was this, the forty-third annual meeting, held in Bingley Hall. So closely following upon the recent great Chamberlain meeting, it taxed to the utmost the resources of Mr. J. Hughes (the secretary) and his energetic committee in their endeavour to complete the vast amount of staging and other arrangements by the day preceding the opening. It may safely be averred that never have such fine blooms, as a whole, been shown in Bingley Hall. Regarding fruit, however, notably Apples and Pears, there was a marked falling away. The display of vegetables has never, however, been excelled in quantity and quality. Mr. E. Beckett, gardener to Lord Aldenham, annexed the chief prizes for vegetables. Honorary exhibits, as usual, were numerous, and contributed greatly to the enhancement of the show. A unique feature was the collection of choice Cacti and other succulents grown by Mrs. J. G. Thomson, Handsworth. This novel exhibit proved a pleasing relief to the blaze of colour around. A Silver Medal was bestowed.

Another interesting and instructive exhibit was that by Mr. James Udale, horticultural instructor to the Worcestershire County Council, from the Experimental Gardens at Droitwich. The exhibit consisted of Onions, Parsnips, and Carrots, reared on different manures, in three sections, viz., stable manure, supplemented by chemicals, gave Onions which yielded at the rate of 26 tons 7cwt to the acre; in the case of mixed chemical manures, 9 tons 11cwt was the result; while with garden refuse it was 25 tons 8cwt per acre. A collection of dried fruits was also shown by Mr. Udale. Enchanting were the exceedingly beautiful floral designs and bouquets contributed by Messrs. Perkins and Sons, Coventry; and a similar display by Messrs. Gunn and Sons, of Acock's Green. Messrs. Perkins and Messrs. John Pope and Son were the respective winners of the prizes offered for hand bouquets. The groups of Chrysanthemums arranged for effect (open class) were considered the best ever exhibited in Birmingham. Mr. J. V. Macdonald, gardener to G. H. Kenrick, Esq., Edgbaston, gained first, £10, and a magnificent Silver Coronation Challenge Cup, given by George Cadbury, Esq. Second prize fell to Mr. W. Thomson, of Moseley. The third prize went to Mr. Alfred Cryer, gardener to J. A. Kenrick, Esq., Berrow Court, Edgbaston.

Collections and single plants of Chrysanthemums were very well exhibited, the principal prizetakers being Mr. Oliver Brasier, Mr. J. Maldrem (gardener to George Cadbury, Esq., Northfleet), Mr. A. Cryer, and Mr. R. Jones (gardener to C. A. Smith-Ryland, Esq., Burford Hall, near Warwick).

A fine feature was the vase class for cut blooms. A more beautiful and uniform arrangement would have been found by

adopting one row only, with also a few inches lowering of the wooden staging. The Committee will doubtless adopt some modification in future. In the class for eight vases of distinct Japs, five blooms of each, the first prize of £4 10s. fell to Mr. E. J. Brook (gardener to Colonel Beech, Coventry), with fine examples. He had F. S. Vallis, Mrs. G. Mileham, Bessie Godfrey, Mrs. Barkley, Miss Mildred Ware, Guy Hamilton, and Ethel Fitzroy. The second award fell to The Leamington Nurserymen and Florist Company; and third to Mr. J. H. Goodacre, Elvaston Castle Gardens.

In the class for six Japs, Mr. E. J. Brook was again to the fore with grand blooms of Mdme Carnot, F. S. Vallis, Guy Hamilton, W. R. Church, Mdme. Paoli Radaelli, and Mrs. Barkley. A close second was Mr. T. Pritchard, Umberslade Hall; and third, Mr. J. Rick, gardener to G. H. Hadfield, Esq., Ross. For four distinct Mr. W. Martin, Erdington, was placed first, and second Mr. S. Horton, Walsall. For two distinct, Mr. R. Barnes, Malvern, was to the fore; second, Mr. S. Horton. For pink Japs, Mr. C. Crooks, gardener to the Dowager Lady Hindlip, Droitwich, won with a fine exhibit of Mdme. P. Radaelli; second, Mr. S. Horton. For a crimson Jap, Mr. T. Pritchard scored with grand blooms of W. R. Church; second, Mr. C. Crooks with the same. For a white Jap, Mr. F. Biddle, gardener to A. Heaton, Esq., Handsworth, was first with Mdme. Gustave Henry; second, Mr. A. Taylor, Acock's Green, with Nellie Pockett. For a yellow Jap, the first prize fell to Mr. C. Crooks with F. S. Vallis; second, Mr. R. Barnes, Malvern, with Mons. Louis Remy.

In the class for eighteen distinct incurveds the first prize was annexed by Mr. J. H. Goodacre with a board of grand blooms; second, Mr. W. L. Bastin, gardener to Sir A. Henderson, Bart., M.P.; third, Mr. C. Crooks. For twelve incurveds Mr. Crooks was to the fore; second, Mr. Bastin; and third, Mr. Manning, of Dudley. For eighteen Japs, Mr. E. J. Brooks led; Mr. C. Crooks, second; and the Leamington Nursery Company, third. For twelve Japanese incurved, Mr. R. Jones was first, Mr. W. Manning second, and Mr. H. Needham, Erdington, third. There were several other classes for local growers only.

Fruit was well represented, especially in the Grape classes. Mr. J. H. Goodacre had well-finished Muscat of Alexandria. His fine collection of fruit included Melons, Apples, and Pears. For a collection (40 square feet), the first prize of £5 and the Veitch Memorial Medal, and £5 offered by the Veitch Memorial Trustees, was annexed by him. The second prize of £6 was not awarded, but the third of £4 was given to Mr. J. Read, gardener at Bretby Park, for a collection of black and white Grapes and Apples only. The adjudication was subjected to considerable adverse comment.

In the class for six bunches of Grapes, three varieties, open to all, Mr. Goodacre again distinguished himself by securing the first prize; and Mr. J. Jones, gardener to Mrs. F. Need, Malvern, was placed second with very good fruit. For three black Grapes, Mr. R. Jones scored with compact bunches of Gros Colman; second, Mr. H. Folkes, gardener, Hemel Hempstead, with fine, well-finished bunches of Black Alicante. For three bunches of white Grapes, Mr. Goodacre led; second, Mr. J. Rick, with White Nice. Apples and Pears, considering the past season were fairly well shown, and a local grower, Mr. R. M. Mole, Edgbaston, was awarded a "Highly Commended" for a dish each of Durondeau and Pitmaston Duchess Pears, not for competition. There was keen competition in the vegetable classes for the substantial prizes offered by Messrs. Sutton and Sons, Messrs. Webb and Sons, Messrs. Simpson and Sons, Messrs. Richard Smith and Co., and Messrs. Thomson and Co.

In the numerous honorary exhibits, which so much enhanced the exhibition, mention may be made of the fine group of plants and cut flowers staged by Mr. J. Deacon, gardener to the Right Hon. Joseph Chamberlain, at Highbury, to which a Gold Medal was awarded.

Gold Medals were also awarded to Messrs. Webb and Sons, Messrs. John Waterer and Sons, Mr. John Basham, Messrs. Yates and Sons, Messrs. Richard Smith and Co., Messrs. Gunn and Sons, Messrs. Perkins and Sons, Messrs. Thomson and Co., King's Acre Nursery Co., Limited, and the Worcestershire County Council Experimental Gardens.

Silver Medals to Messrs. W. B. Child, C. H. Herbert, Mr. J. White, Messrs. Hewitt and Co., Messrs. Pope and Sons, The Vineries Co., Limited, Mr. J. Austin, Messrs. Thomson and Co., Mr. W. J. Godfrey, Messrs. J. G. Thompson, Messrs. Pewtress Bros., and Messrs. Cliban and Son. Bronze Medals to Mr. H. Deverill and W. Wells and Co., Limited. A Certificate of Merit went to Mr. Whitehouse.

It is noteworthy to observe that amongst the visitors on the opening day was a deputation of upwards of a score of the members of the Banbury Chrysanthemum Society, accompanied by the hon. sec., Mr. W. H. Walkley, the Mayor of Banbury. The deputation was cordially received by Mr. W. Butler (the president of the Birmingham Society) at the judges' luncheon in Bingley Hall. The visit would be well worthy of imitation by kindred societies.

## Reading (Berkshire), November 11th.

The Reading Committee and the active secretary, Mr. W. L. Walker, can get together a very fine display of Chrysanthemums and other winter flowering plants, but for lack of a large enough hall the display has to be placed in the old and new Town Hall, which are divided by a corridor. In the old Town Hall were the groups of Chrysanthemums, the cut blooms, and the fruit; and in the new hall the various plants and cut blooms.

A challenge cup (given by Mr. Keyser) for a group fell to Mr. Barnes, gardener to A. F. Walter, Esq., Bearwood, Wokingham. Mr. Keyser (gardener, Mr. Galt) being second. Mr. Grant, gardener to Lady Lucas, Heatherwood, Ascot, was a good third. In the class for a floral decoration of not less than three distinct sections of Chrysanthemums arranged as a group, Mr. Exler, gardener to Lady Cook, East Thorp, Reading, was first, and Mr. Grant came second.

Cut Blooms.—The first prize for twenty-four incurveds was won by Mr. Bible, Draycott Park, Chippenham, having well-developed blooms and a good Mrs. Judson (an excellent white). He was the only exhibitor. In the twenty-four Japs Mr. Ashman, Billingbear Park, Wokingham, came first with excellent blooms of F. S. Vallis, Alfriston, (a variety said to surpass E. Molyneux), Dorothy Pywell, Mabel Morgan, Nellie Bean, W. R. Church, &c. Mr. Cole, gardener to Sir C. Russell, Bart., Swallowfield, came a good second. He had Miss E. Fulton, Mrs. J. C. Neville, F. P. Archibald, Mrs. Greenfield, Lord Ludlow, Sensation, Bessie Godfrey, &c. With twelve Japs, Mr. Barnes was first; Mr. Nicholls, Strathfieldsaye, second. With twelve incurved, Mr. Galt came first, and Mr. Simms, gardener to the Marquis of Downshire, Easthamstead Park, was second. Twelve specimen Japs with foliage saw Mr. Nicholls leading, and Mr. Hunt, gardener to R. Moss, Esq., Blackwater, second. The best six vases of specimen Japs, three in each, brought several competitors. Mr. Nicholls led with some fine blooms; Mr. Cole, Swallowfield, a close second; Mr. J. Gibson, gardener to R. W. Hudson, Esq., Danesfield, Marlow, well up as third. Twelve bunches of single varieties made a very pretty feature. Mr. W. B. Monck, Reading, came first, and Mr. Wilson second. For one variety, Mrs. G. Mileham and Mdme. P. Radaelli were the best kinds. C. H. Curtis and Ialane the best "one variety" incurveds.

For a group of cut blooms of Chrysanthemums with Ferns and foliage, Mr. Page, Dropmore, Maidenhead, was first, and Mr. Bright, Reading, second.

In the open classes for fruit, the prizewinners were Messrs. Coote (Marchfield, Chippenham), Nicholls, Cole, Brown (Englefield Green), Galt and Page for Grapes. For Apples and Pears Mr. Ashman (Billingbear), and F. B. Parfitt (Caversham).

## Frome (Somerset), November 12th.

The annual show of the Frome Chrysanthemum Society was very creditable to the town and the management. The popular secretary is Mr. J. H. Vincent. Lord Ludlow, as president of the Society, was present to support Lady Ludlow in the opening ceremony.

The Frome Fruit and Flower Company secured extraordinary success in several sections of the show, no less than nine first prizes falling to their credit for Chrysanthemums alone. For twenty-four cut blooms their manager, Mr. Mines, staged Mafeking Hero, Henry Stowe (grand), Duke of York, M. J. Golder, Mrs. E. Hunnewell, Mdme. Herrewewe, N. Pockett, Guy Hamilton, and J. R. Upton, all in splendid form, size, and colour. Mr. J. Pope, gardener to Chas. Bailey, Esq., Frome, was a good second, Calvat's Sun, Mr. J. Bryant, Godfrey's King, and Mdme. P. Radaelli being fine. Mr. Pitman, gardener to F. G. Lemon, Esq., third. Mr. Mines staged similar varieties in the class for twelve Japs, followed by Mr. Pitman, and Mr. Robertson, gardener to J. S. Doune, Esq., Castle Cary. Mr. Mines won for twelve Japanese incurveds; Messrs. Cray and Sons and Mr. Wilson (gardener to the Duke of Somerset) following. With J. R. Upton, Mr. Mines won for six of one colour. Staged in vases, the Chrysanthemums were most handsomely displayed. The Duke of Somerset's exhibit was a large one, composed of specimen blooms, arranged with beautiful taste. Messrs. Cray and Sons and Mr. Mines also added to this, the finest feature of the cut flower classes. Mr. Pope staged handsomely in the class for three vases, containing three blooms each, and Mr. Strugnell won with three vases of singles.

The decorated dinner table is always a good feature of the Frome shows, and Mrs. Woodland and Mrs. Hole were in their best form.

Groups of Chrysanthemums are said to be as fine as at any provincial show in the country, from both trade and private sources. Mr. Mines and Messrs. Cray were the contestants, the former winning. Mr. Pope represented the gardeners' section. Mr. Cutler, gardener to Mrs. Le Gros, was a good second. Except in Grapes, the fruit classes were not very well filled.

Mr. Pearce's honorary exhibit from Marston Gardens covered

a space nearly 400ft square, and was composed of Palms, Chrysanthemums, Crotons, Dracenas, Begonias, &c. The Crotons were intensely bright in colour, most diversified, and of a size well adapted for grouping purposes, and with skilful blending the whole form an imposing and dignified exhibit, receiving just praise from everyone.

Mr. Gandy, gardener to the Marquis of Bath, arranged an oval-shaped group, chiefly composed of flowering plants, and afforded an agreeable contrast to the wealth of foliage from Marston. Chrysanthemums, Palms, Poinsettias, Begonias, and freely bloomed Marguerites were deftly arranged, and give a mass at once bright and effective.

### Bradford (Yorks), November 13th and 14th.

The seventeenth annual exhibition arranged by the Bradford and District Chrysanthemum Society was opened in St. George's Hall, Bradford. Exhibits were included from Rugby, Penrith, Chippenham (Wiltshire), Ripon, Chester, Liverpool, Leicester, Cardiff, Hull, and other places remote from Bradford. A further demonstration of the committee's enterprising policy was to be found in the amount of prizes offered in the chief open competitions, in one of which, in addition to a silver challenge cup, valued at ten guineas, money prizes amounting altogether to £28 10s. were offered for twenty-four Japanese blooms. The number of competitors for this coveted prize was eight, and Mr. A. Chandler, gardener to Arthur James, Esq., Coton House, Rugby, was first with the following principal flowers: F. S. Vallis, Marquis V. Venosta, Bessie Godfrey, Australie, Duchess of Sutherland, Mrs. Weeks, Sensation, Mafeking Hero, George Hamilton, Henry Stowe, Mrs. Barkley, Miss Mildred Ware, Fred Cadbury, Mrs. G. Mileham, W. R. Church, Lord Ludlow, Ethel Fitzroy, and Mrs. J. Bryant. Mr. Chandler was also successful in carrying off the prize for the champion Chrysanthemum bloom in the exhibition, a specimen of the variety F. S. Vallis. This flower, it may be mentioned, was no less than 8½in in height, the circumference being not so extraordinarily large. Mr. F. J. Clark, of Leicester, came a splendid second to Mr. Chandler's first, and the third prize was awarded to Mr. F. S. Vallis, of Chippenham, Wiltshire, a gentleman who enjoys the reputation of being one of the most successful cultivators of the Chrysanthemum in England. In the incurved section Mr. Emanuel Ellis, of Haswall, Cheshire, was first with the following beautiful flowers: Madame Ferlat, F. Hammond, C. H. Curtis, G. Symonds, Perfection, Duchess of Fife, Pearl Dauphinois, Edith Hughes, V. Foster, J. Seward, Fred Palmer, Lady Isobel, Ralph Hatton, Pearl Palace, Glory Bruant, Mrs. W. G. Jones, and Nellie Southam. Mr. Ellis was also the winner of the first prize in this class last year, and his exhibit this year includes very remarkable specimens.

For the taste and skill displayed in the arrangement of the hall compliments are to be offered to Mr. W. Horsman, chairman of the committee, and his colleagues, among whom are many professional gardeners, and Mr. H. Spencer, hon. secretary, who have been assiduous in their efforts to promote the success of the exhibition. The following contributed exhibits "not for competition": Messrs. W. Wells and Co., Limited, Redhill, Surrey, group of Chrysanthemums; and Mr. Arthur Edwards, florist, Arnold, Notts, "Edwardian" table and room decorations. The following were the judges: Mr. Wilson, Swanland Manor, near Hull; Mr. Leadbetter, Tranby Court, Hull; Mr. Ireland, Sedgwick House, Kendal; and Mr. M. Midgley, Bingley.

### Leeds Paxton, November 13th and 14th.

This year's exhibition compared very favourably with other years, and was very tastefully arranged in the Town Hall. Excellent exhibits of cut flowers were to be seen, including the varieties shown in vases, grown naturally, single, and Japs. The receipts were as good as last year, and these were equal to the demands of expenditure. A record was created when J. Boyle, Esq. (gardener, Chas. Shaw), Askett Hill, Roundhay, won both challenge cups, open and local, for thirty-six blooms, eighteen Japs and eighteen incurved, distinct; and twenty-four, being twelve of each. He is a local man, and the excellent specimens exhibited by him reflect great credit for so young a grower.

The show was almost solely representative of local floriculture, but the quality is none the less admirable, and indicative of a high degree of skill. First prize in the open class for miscellaneous groups of plants was taken by the Hotel Majestic, Harrogate, with Mr. Matthew Kitchen, Roundhay, second, and Mr. T. G. Mylchreest, Thorner, third. In the open class for thirty-six Chrysanthemums (cut blooms), half incurved and half Japanese, first prize was taken by Mr. J. Boyle, Askett Hill, Roundhay, with Mr. R. I. Critchley, Dewsbury, second. Mr. Critchley was first for eight vases of Chrysanthemum blooms, and Mrs. Bowring second. The Hotel Majestic took premier honours for twelve vases of naturally grown Chrysanthemums, and also for the same number of vases of blooms of single varieties, Mr. J. Boyle being second in the former, and Mr. R.

Critchley in the latter instance. The prizewinners in the local class for twenty-four blooms of Chrysanthemums (twelve incurved and twelve Japanese) were Mr. J. Boyle and Mrs. Bowring in the order named. Mr. Matthew Kitchen, Roundhay, was first for twelve blooms, Sir James Kitson coming second. The chief winners in the classes for fruit are Mr. T. Arton (Rawdon), Ald. A. T. Walker, Mrs. White, and Mr. Mylchreest. The judges were Mr. W. Daniels (Dewsbury), Mr. F. R. Hayes (Keighley), Mr. Chas. Lawton (Welton, Brough), and Mr. D. Williams (Duncombe Park).

### Sheffield (Yorks), November 13th and 14th.

SUMMARY.—A very excellent show was displayed. Mr. Higgs was forward with incurveds, and Mr. Vallis with Japs. Messrs. W. Clibran and Son, Artindale and Son, H. J. Jones, and S. W. Seagrave staged splendid non-competitive exhibits.

This show, which is probably the most important in the North, was held in the Cutler's Hall on Friday and Saturday last. Competition was extraordinarily keen in the cut bloom classes. Japs were a wonderful show, while incurveds were very good, Mr. Higgs's exhibits being in the pink of perfection. The groups were an improvement upon previous years, and were very creditable. Table decorations were very good. The "Trade" turned up in full force.

The entries were in excess of previous years, and the standard was invariably high, in many cases the whole of the four judges being called in to decide the order of merit. The judges were Mr. H. J. Jones, Mr. D. B. Crane, Mr. W. Kipps, and Mr. T. Welch, and their opinion was that the incurveds were finer than at the Crystal Palace. In the open class for twenty-four of this section, eighteen distinct varieties, prizes £7 10s. and silver medal: £5, £3, and £2, Mr. Higgs was first with a superb lot, the best of which were May Phillips, W. Higgs, Mrs. F. Judson, Chas. Curtis, C. Blick, Hanwell Glory, Ma Perfection, Ialane, Miss A. Dighton, and Mrs. Bernard Hankey. It is worthy of note that Mr. Higgs has never been placed second for incurveds for six years. Mr. G. W. Drake, of Cardiff, was a good second, with J. D. Ellis, Esq. (Mr. Alderman) and the Dowager Lady Hindlip (Mr. Crookes) third and fourth respectively.

In class 2, for twenty-four Japs, there was very close competition, and here Mr. F. S. Vallis was placed first with a very fine lot, in which W. R. Church, F. S. Vallis, Sensation, and Nellie Pockett were particularly good. Mr. Higgs was a good second. Mr. Crookes was third with a good lot, which, though containing good examples of F. S. Vallis, W. R. Church, Madame Paolo Radaelli, Duchess of Sutherland, Lord Ludlow, Mildred Ware, Calvat's '99, Madame Cadbury, General Hutton, and Mrs. Barkley (the latter particularly fine), somewhat lacking in arrangement of colour. Mr. Alderman was fourth. In class 3 (twelve incurveds) Mr. Higgs was again first and Mr. Crookes second; while for twelve Japs Mr. Crookes was first, and in this board Sensation was undoubtedly the best, though there were good examples of Marquis V. Venosta, F. S. Vallis, M. Louis Remy, and Bessie Godfrey. Mr. Vallis was second with fine blooms of W. R. Church, Nellie Pockett, F. S. Vallis, Sensation, and Madame Hoste. For six incurveds Mr. Crookes was easily first, with Mr. J. Harrison second; and for six Japs Messrs. Crookes, Drake, and Harrison, in the order named. For a vase of five Jap blooms, one variety, Mr. T. Lucas, Ashgreve, was a good first with Miss Roberts; Mr. W. Green and J. G. Graves, Esq. (Mr. Abbott), next, in this order.

In the district classes (limited to twenty miles radius), Mr. Abbott was first with some fine blooms and foliage plants nicely arranged, closely followed by G. Senior, Esq. (Mr. R. C. Baker).

Black Grapes: Mrs. A. Barnes (Mr. Nelson), Chesterfield, Mr. Alderman, and Mrs. Tuckwood, were so placed in both the open and district classes; while for white Grapes Messrs. Nelson, Abbott, and Tuckwood were in the order named.

Begonia Gloire de Lorraine, six plants: Mr. C. Scott, Worksop, first; and Mr. Lucas, Ashgrove, second. In the classes for twelve incurveds, twelve Japs, six incurveds, and six Japs, Mr. Alderman, Mr. Scott, and Mr. T. J. Nelson were placed in the order named in each class; while for twelve Jap blooms, arranged with foliage plants for effect, Mr. T. Lucas was first and Mr. C. Scott second.

In class 57 (table decorations) Mr. A. Sheridan led with a very effective arrangement of Gloire de Lorraine Begonia and Lily of the Valley; Mr. J. Adlington, Chesterfield, being second with a chaste arrangement of Cattleyas and Den-drobiums. Small foliage plants, however, gave it a rather heavier appearance. Mr. Bateman was third with single Chrysanthemums rather overdone. The cottagers' classes were exceedingly well contested.

Another very attractive exhibit which came in for unqualified admiration was that of Messrs. Clibran and Son, of Altrincham. This firm had about 100 pots of Cyclamens with a profusion of blooms. It is undoubtedly a fine strain, flowers of large size and good colour, their Improved Salmon Queen being a distinct improvement. The early state of these was quite an attraction; and a grand display of Clibran's Celosias came in for a great

deal of attention. They were very fine. In Chrysanthemums the firm showed some valuable varieties of singles, particularly fine being Stella (white) and Mrs. R. N. Parkinson (yellow). These should prove a great acquisition to our single varieties. They also had Lilian, Richard Boston, Mrs. E. Roberts, Emily Clibran, Mrs. Henry Herbert, Mr. Will Jordan (grand colour), and Crissy. Two new incurveds were shown, being the firm's own seedlings: Wm. Biddle and Souvenir de Wm. Clibran, both good; also La Fusion (new). Of the Japs they had Queen Alexandra, Miss Baden Powell, Lord Hopetoun, Bessie Godfrey, W. Duckham, &c. A fine batch of retarded Lily of the Valley was also exhibited, and a gold medal was awarded. The exhibit, as a whole, fully sustained the reputation of the firm, and was a distinct credit to Mr. H. Evans, who was in charge.

A distinct feature of the exhibition was the exhibit of Messrs. W. Artindale and Son, which showed the florist's art to perfection. Among the floral designs was a large cross of Neapolitan Violets, a cushion of Neapolitan Violets with "R.I.P." worked in Lily of the Valley, and Dendrobiums and Cattleyas in relief. They had an immense anchor of Chrysanthemum J. H. Wright, an ivory-white, an invaluable variety for the purpose; also a floral Bible of Violets with "I.H.S." worked in relief; and a heart composed of Lily of the Valley and Lawson Carnations. There were also wreaths and chaplets and baskets of Cattleyas and Roman Hyacinths, Rose Catherine Mermet, Franco Carnations, and a grand batch of Turnford Hall Begonia. This firm also exhibited thirty-two immense Pears, weighing over 65lb. These Pears had taken first prize for five, and for twenty-five, heaviest Pears at the Jersey Pear Show. A gold medal was awarded.

Another fine exhibit was a grand group by Mr. S. W. Seagrave (gold medal), which included some grand pieces of Begonia Sanderi, Acalyphas, Cocos Weddelliana (very fine), and C. Veitchi. The arrangement was very effective. This firm had also a grand display of winter flowering Geraniums (Pelargoniums), particularly good being The Sirdar, Zenobia, Snowdrop (pure white), Barbara Hope, Mary Pelton, Winston Churchill (new), and Chaucer (very fine).

Mr. H. J. Jones exhibited some novelties for 1904 in Japs and incurveds, including A. L. Stevens, Brenda, Mrs. J. Dunn, Maud du Gros, E. H. Parker, Miss P. Chittenden. Certificates were given for Major Powell Cotton (Jap) and W. Pascoe (incurved).

The silver cups for affiliated societies were won by the Nether Hallam Society (M. H. Willford, secretary) for twenty-four blooms; and by the "Sun Inn" Society (J. H. Reader, secretary) for twelve blooms; "Sun Inn" and Chesterfield being second and third for twenty-four, and Nether Hallam and Mexbro' second and third for twelve.

At the opening ceremony Councillor F. A. Kelly, Esq., humorously asked if gardeners could not produce a blue Chrysanthemum. The president, S. Roberts, Esq., M.P., made a feeling allusion to the death of the late secretary, Mr. Wm. Houseley, and appealed for increased support to the society. A word of praise is due to Mr. Willford, the new secretary, for the able and business-like way in which he grappled with the arduous duties taken up at a critical time, and under difficulties created by the sudden death of Mr. Houseley, just when the real work of the year was commencing.—W. L.

### West Hartlepool, Nov. 17th and 18th.

The annual autumn show was held in the Town Hall, and if the entries were less numerous than in some past seasons, it was owing to the unusual wet weather prevailing in the neighbourhood during the greater part of the year. Even on this occasion the exhibits were numerous enough to make an interesting display. In the open classes there was keen competition: For a group of Chrysanthemums to occupy 54 square feet there were but two entries. Both, however, were good. Mr. T. Smith, gardener to W. Maclean, Esq., Grantully, West Hartlepool, was distinctly ahead with dwarf plants well furnished with foliage, and carrying good blooms. The arrangement, too, was all that could be desired. Mr. A. Lauder, gardener to T. Robinson, Esq., Briarfields, West Hartlepool, second, with smaller blooms in an effective arrangement. Groups of Chrysanthemums in the amateur section were remarkably good. Mr. W. Mossman, West Hartlepool, was first with an especially neat group. Mr. J. A. Wright, West Hartlepool, second.

**CUT BLOOMS.**—For twenty-four incurved there was but one entry, Mr. T. Smith, who was awarded first prize for medium sized, neat examples. The following were especially noteworthy: Ma Perfection, Miss N. Southam, Madame Ferlat, Hanwell Glory, C. H. Curtis, and Mrs. W. E. Egan. In the Japanese section there was keen competition and good blooms. For twenty-four in not less than eighteen varieties Mr. A. Waller, gardener to J. Hill, Esq., Brockley, was an easy first, with large, handsome blooms of Mrs. Barkley, Mons. Chenon de Léché (premier bloom in the show), W. R. Church, Simplicity, Mrs. T. W. Pockett, Mrs. Mileham, F. S. Vallis, Nellie Bean, M. Louis Remy, Mrs. E. Hummel, Lord Salisbury, Mrs. J. E. Clay-

ton, Madame von Andre, and Mrs. Greenfield. For six Japanese yellow, Mr. Findlay, gardener to W. Dorman, Esq., Grey Towers, Nunthorpe, won with Lord Ludlow. Mr. Waller second with Mrs. Greenfield. Mr. T. Smith third. For the same number, any white variety, Mr. Lauder, with Nellie Pockett in good condition, was the only exhibitor, and was awarded the premier place. For six, any other colour but those named, Mr. Waller, with really fine blooms of W. R. Church, was an easy first. Mr. A. Findlay followed, Mr. Smith coming third.

Japanese in vases made a good display. For four varieties, three blooms of each, Mr. Findlay, with really fine examples of Mrs. Mileham, Le Grand Dragon, Gustave Henry, and Vivian Morel, was an easy first. Mr. A. Waller second, Mr. Lauder third. The local classes created much interest. The chief class was that for twelve incurved and twelve Japanese, distinct. Mr. T. Smith, with compact blooms neatly staged, won the coveted award, silver challenge cup. C. H. Curtis (premier incurved bloom in the show), Lord Alcester, Queen of England, Madame Ferlat, Miss N. Southam, Ernest Cannell, J. Agate, and Golden Madame Ferlat were the most noteworthy in the incurved section. Lord Ludlow, Kimberley, Henry Weeks, Mrs. Barkley, M. Chenon de Léché, and Miss Alice Byron were conspicuous amongst the Japanese. Mr. F. Jackson, gardener to J. F. Wilson, Esq., Pangbourne, West Hartlepool, second. Mr. A. Lauder third.

In competition for the "Emmerson" Cup amongst amateurs, twelve distinct varieties were asked for. Mr. R. W. Nicholson, 31, Thornhill Gardens, West Hartlepool, was the fortunate winner, with medium sized, neat blooms. Mr. P. Harrison, Percy Street, West Hartlepool, was a close second. Mr. J. W. Wright third.

A very pretty display was made in the class for six sprays staged in a vase. Mr. R. W. Nicholson, West Hartlepool, had the best of eight entries. Mr. Mossman second, Mr. W. Shires, West Hartlepool, third. In a similar class in another section there was a capital display. Mr. A. Lockety, West Hartlepool, was the most successful, with a pretty exhibit, well illustrating this type of Chrysanthemum for decoration. Mr. W. Pouley, West Hartlepool, second.

### The Horticultural Club, London.

On Tuesday the 10th inst., the usual monthly dinner of this Club took place, under the presidency of Mr. Harry J. Veitch, and was well attended, a paper having been announced on "Vegetable Curios," by Mr. G. S. Saunders, F.L.S., as the special attraction on this occasion. The branch of this extensive theme, with which the lecturer specially dealt, was that of malformations in flowers and fruit, rather than the more general one of "sports" proper, and the paper was rendered the more interesting by the exhibition of a large number of beautifully-executed drawings of specimens which had come under Mr. Saunders' personal notice. A considerable number of these represented curious divergencies from the normal structure of Cypripedium flowers, which appear peculiarly prone to their production, the various parts of the flower appearing abnormally changed in form, or even duplicated or reversed, although in the large majority of cases the modifications can be traced as mere change of form of normal parts, and rarely as actual additions. In these cases of simple malformation, as in most of the others described and exhibited, such as double fruits, foliaceous flowers, and fasciation, the peculiarity was almost invariably confined to the individual plant, or even the individual flower; and although recurrent cases were cited, they seemed, as a rule, incapable of reproduction through the seed. It was also pointed out that similar eccentricity was much rarer in leaves than in flowers, due, presumably, to the higher specialisation of the parts of the latter, many abnormal forms of which were obviously due to more or less reversion to the primary leaf type.

The cause is a mystery, as it is with "sports" proper. In the subsequent discussion, in which the Rev. Mr. Henslow, Mr. Harry Veitch, Mr. Walker, Mr. Drucry, Mr. Chas. Pearson, and Dr. Cooke took part, Mr. Henslow cited a number of abnormalities on similar lines to those mentioned by the lecturer, and gave some explanations regarding the particular modifications of the floral organs, &c., involved. Double flowers were also alluded to, very opposite opinions being expressed as to the reason why they appeared, starvation being adduced as one reason, while Mr. Harry Veitch cited the very apposite, though opposite case, of double Rhododendrons raised by his firm by fertilisation from apparently accidental petaloid stamens, where the highest culture prevailed throughout. Mr. Walker mentioned several cases, and said he could cite many more, of Narcissus sports or reversions occurring in his cultures, which he felt inclined to refer to sudden change of treatment. Mr. Drucry referred to the innumerable curios which had originated among Ferns, in which modifications of the leaf equivalents, or fronds, were singularly marked as well as numerous. He also pointed out the strong resemblance and yet essential difference between fasciation and creting to which most Fern species seemed subject, though among flowering plants no definite instance

could be cited. Finally he strongly deprecated the classing of symmetrical sports, capable of true reproduction through spore or seed, with what had been previously described as Barnum-like "freaks," which, he maintained, belonged, like the malformations cited by the lecturer, to a different category altogether. A hearty vote of thanks to the lecturer concluded the proceedings.

### Birmingham Gardeners' Improvement.

At the latest meeting the subject was "Vegetable Growing in and Around Large Towns," by Mr. Alfred Cryer, Berrow Court, Edgbaston. The lecturer contributed information regarding the difficulties he had had to contend with on a hungry soil—a light one overlying a deep gravel bed. But with a judicious application of suitable animal and chemical manures, he had been enabled to produce vegetables of excellent quality, though not so large as those grown under more favourable circumstances. His large collection of about twenty kinds testified to the merit of his cultivation. A certificate of merit was awarded the collection. A first class certificate was awarded Mr. F. Dedicott, gardener to W. H. Wiggin, Esq., Griffins Hill, Selly Oak, for very fine examples of Cyclamens grown under the system advocated by Mr. Lohrmann at one of the society's meetings last spring. Mr. Lohrmann expressed his gratification in witnessing such a signal success of the adoption of his system of culture. He also remarked upon the comparative methods of vegetable culture in North Germany and the severity of some of the winter seasons there.

### Liverpool Horticultural.

On Saturday evening, the 7th inst., the above association commenced its series of readings and discussions, and on this occasion Mr. E. F. Hazelton, The Gardens, Knowsley, read a paper on "The Culture of Pot Roses." The Hall (7, Victoria Street) was crowded. Mr. Hazelton dealt with his subject in a short and pithy manner, yet, withal, practical and to the point; describing the history of the Rose, the different methods of propagation, potting material to be used successfully; treatment which should be carried out in forcing Roses, and a list of the most suitable varieties. Although the paper was somewhat shorter in length than is usually read at these meetings, we do not remember a better or more instructive discussion being created, lasting, as it did, over an hour, and drawing out points which had either been omitted or touched upon but slightly in the paper. Messrs. Ashton, Ranger, Haynes, Stoney, Ewbank, Waterman, and others took part in this, and Mr. Hazelton answered each question fully and in a most ready manner. Mr. Foster, chairman, congratulated the committee in having such a large attendance for their first meeting, and hoped that members would endeavour to bring friends, and show their appreciation of the trouble taken by the gentlemen who read these papers. A vote of thanks to Mr. Hazelton and the Chairman concluded the meeting.—J. S.

### Young Gardeners' Domain.

#### *Bouvardia Humboldti grandiflora.*

The pure white flowers and delicious fragrance of this *Bouvardia* make it deservedly a favourite wherever grown, though its short period of flowering is rather a drawback. The old plants, having now gone out of flower, should be dried off and placed in a cold house till required, giving just an occasional watering to prevent them becoming quite dried up. To get a batch of young stock, a few plants should be placed in a warm house in January. Cuttings will soon be produced in quantity, and root readily round "thumb" pots in a propagating pit. When rooted they should be potted up into "thumbs," placed close to the glass, and gradually hardened off, stopping them frequently to get a bushy plant. The final potting in 48's should take place about the middle of June, a rather light compost suiting them well. They should be grown as hardy as possible through the summer. If larger plants are desired, the old stools should be cut hard back, and when growth has commenced be shaken out and potted in the same size pots. One shift after this will suffice, and the same attention to stopping will produce a large head. The final stopping should take place not later than the end of July, and September should see the plants housed in a warm greenhouse.—W. J. B.

#### Cannas as Winter Blooming Plants.

These are subjects which are chiefly grown for summer decoration, and it is not generally known that they can be had in bloom during the dark days of winter. Where suitable room can be given them, and a temperature of from 60deg to 65deg Fahr. maintained, a succession of batches can be had during

the next three or four months with a little forethought and attention. A heated pit or small forcing house is best adapted for the purpose, as the plants can be grown near the glass, which is a great advantage in many respects, as they require every ray of light possible to be obtained at this time of the year.

Prepare a number of offsets from plants which have flowered during the summer, and which are large enough to produce a flower spike, by rubbing out all surrounding eyes so as to leave one strong crown. Pot these singly in well drained 5-inch pots, in a compost consisting of two parts good fibry loam, one of well rotted farmyard manure, and the remaining part of good flaky leaf mould, with a fair sprinkling of coarse sand. Place the plants in a suitable structure, and in the temperature above stated, and give a soaking of tepid water. Keep the atmosphere close and moist until the offsets start into growth, after which air can be afforded on suitable occasions. Being gross feeders the pots will soon be filled with roots, and feeding must be resorted to, and they will stand a good amount of this treatment. Nothing suits them better than liquid cowdung manure, with an occasional light sprinkling on the surface of the soil of Clay's or some other well-approved fertiliser; and should any small breaks appear they can be snapped off under ground.

In three months, or thereabouts, from the time of potting they will each form a flower spike, and as they approach the time of opening the temperature should be gradually reduced until it reaches that of the house or conservatory wherein they are to remain whilst in bloom, and it will be found that they will make a lasting and brilliant display. A few good varieties are Admiral Avellan, Asia, Black Prince, Charles Henderson, Duke Ernst, Elizabeth Hoss, Hesperide, Oscar Dannecker, President Meyer, and Queen Charlotte.—E. B., South Berks.

[Other communications have unavoidably to be held over.—Ed.]

## Patents and Inventions.

### Beckett's Tree Ties.

These are the invention of the well-known horticulturist, Mr. Edwin Beckett, and were first shown at the fruit and vegetable show at Chiswick this autumn. They are claimed to

To affix them: Take the tree tie, the buckle outwards and towards the stake.  
1st—Pass the end between the stake and the tree and round the latter (Fig. 1).  
2nd—Pass the end through the loop and between the tree and the stake (Fig. 2).  
3rd—Pull tight round the tree and buckle firmly round the stake (Fig. 3).  
4th—The end, instead of being cut off, may be turned in to allow of slacking off with the growth of the plant. If a tie be fixed nearly at the top of the stake it will prevent that fretting of the bark which so often disfigures and injures staked trees (Fig. 4).

### Beckett's Tree Ties.

entirely supersede the old-fashioned method of tying with strips of cloth and twine. They pack quite flat, but when in use form a complete figure 8 round the tree and support. The material of which they are made is almost like canvas, of a brownish colour. Their advantages may be summed up as follows:—(1) Rigidity. No gyration or friction possible. (2) Simplicity. No loose parts, each complete in itself. (3) Economy. An enormous saving of time and labour. One person can easily affix them. (4) Adjustability. A curved stem can be gradually and effectively straightened. (5) Pliability. Cannot injure the bark; will fit any shaped or sized tree or stake; inconspicuous, neat and strong.

They are made in five sizes, to suit anything, from a Rose tree upwards. Size 1, which is  $\frac{1}{2}$  in in width and 6 in in length, costs 1s. 3d. per dozen, or 12s. per gross; while size 5, which is  $1\frac{1}{2}$  in by 18 in, costs 2s. 9d. per dozen, or 30s. per gross. Sample bands of each size may be had, post free, for 1s. These Ties are obtainable from all nurserymen and horticultural sundriesmen, or direct from the sole maker, Mr. E. C. Lawson, 32, Ashley Road, Hornsey, Rise, London, N.

### Fruit Forcing.

**PEACHES AND NECTARINES: EARLIEST FORCED HOUSE.**—The trees must now be started to ripen the fruit in May, when the varieties consist of Hale's Early, Condor, Dr. Hogg, Stirling Castle, Royal George, and Dymond Peaches, with Early Rivers, Lord Napier, Stanwick Elruge, Humboldt, and Dryden Nectarines. The very early varieties, Alexander or Waterloo, Duchess of Cornwall, and Amsden June Peaches, with Cardinal Nectarines, need not be started until the new year to ripen at the time named. The trees should be thoroughly examined for brown aphid, and if there be the least trace of the pests the affected parts should be brushed over the same way as the growths with tobacco water, and the house fumigated on two consecutive evenings with tobacco paper or vaporised with nicotine. If the roof lights have been drawn off, the border will have been thoroughly moistened down to the drainage, but there must not be any mistake about this, for it is important that the trees have sufficient water at the roots, therefore if any doubt exists on that point give a thorough watering, or apply liquid manure for the benefit of weakly trees. Fire heat need only be employed at night to exclude frost, and by day to ensure a temperature of 50deg. Commence ventilating at 50deg, and close the house at that temperature, ventilating fully without lowering the temperature below 50deg in the daytime.

Syringe the trees in the morning and early afternoon of fine days until the buds begin to show colour, but then (and on dull days prior thereto) discontinue the syringing, yet maintain a genial moisture in the atmosphere by damping the paths and borders on bright mornings and fine afternoons, admitting a little air constantly at the top of the house. Aim at bringing the trees on gradually to secure well-developed blossoms, strong in the stamens, with anthers laden with perfect pollen, and the pistils stout, well advanced above the ovary, and perfect for fertilisation. These, however, will be perfect or imperfect as they are formed in embryo in the previous season, but they can be enfeebled by bringing them on too rapidly, and made thin in the petals, weak in stamens, and slender in pistil, with ill-developed ovary, by not affording time for their perfect development.

**HOUSES STARTED AT THE NEW YEAR.**—Trees started early in the year, and of the old forcing varieties, must be kept as cool as possible. This is best effected by keeping the roof light off the house until the time of starting. The severest weather does not injure the wood or buds, and the trees are then in perfect rest, so far as it is practicable in our climate. Pruning will have been attended to, which is a light affair where proper attention has been given to disbudding and cutting out, after the fruit is gathered, the useless wood. The trees, however, must be examined to remove wood not required and that overlooked during growth. Brown scale is sometimes troublesome, and it is impatient of extremes. Syringing with water at a temperature of 140deg to 150deg frees the branches from the pest, but the water must not be used excessively, it sufficing to rinse every part with hot water. Frost also has a decisive effect on brown scale, and trees exposed in the rest season are seldom affected with it, but it is often introduced from plant houses by persons in charge of ventilation. Trees under fixed roofs may be cleansed from scale by washing them with a solution of carbolic or paraffin soap, 4ozs to a gallon of water, using a stiffish brush, taking care not to dislocate the buds. Secure the trees to the trellis, allowing plenty of space in the ties for the swelling of the branches. Remove any loose, moist soil: supply fresh loam, not more than 2in thick, on the roots, to which add a quart of bonemeal, a similar quantity of soot, and double the amount of wood ashes per barrowload, the whole well incorporated. Mulching the surface with short manure should be deferred until the trees are somewhat advanced in growth. Houses with fixed roofs should be kept as cool as possible, ventilating to the fullest extent, excepting when severe weather prevails.

**HOUSES STARTED IN FEBRUARY.**—The trees started early in February ripen the fruit late in June or early in July, and will now require similar treatment to that advised for those in the house to be started at the new year. The roof lights are very much better removed, but it is a common practice to use houses of the kind for plants requiring protection from frost, especially Chrysanthemums. It is not an advisable proceeding, for the Peach trees are deprived of that rest so essential to success, and it often excites them prematurely, being then followed by a check, as is usually caused when the Chrysanthemums are over by throwing the house open, inducing the

buds to fall. It is also a bad system to leave houses and trees unattended after the leaves fall, and the delay is taken advantage of by red spider and other pests to find safe retreats. The house, therefore, should be thoroughly cleansed, the trees pruned, readjusted to the trellis, and every needful operation performed, so that a start may confidently be made when the proper time arrives.

**HOUSES STARTED IN MARCH.**—The trees in these structures will ripen the fruit in July if brought forward by artificial heat, but where warmth is only given when the trees are in bloom, and to secure the safety of the young fruit from frost, the fruit will not ripen until August or September if kept cool, and the varieties are the usual midseason ones. The house may be a Peach case, or glass-covered wall, with sufficient hot-water piping to exclude frost; afford a genial warmth when the trees near blossom, accelerating the ripening as may be necessary, and ripening the wood in cold districts. The trees are now leafless where they have been subjected to artificial heat to ripen the fruit in August, and should undergo the operation advised for those in the early houses, the roof lights should be removed, the hot-water pipes emptied, leaving the lights off until the blossoms show colour, unless it is desired to start the trees before. If the lights are fixed, the ventilators should be thrown open to the fullest extent, except when frost prevails.

**LATEST HOUSES.**—Late Peaches are quite as valuable as early ones, considering that they are had at much less cost, for all that is required for late houses is a gentle warmth in the hot-water pipes in spring and autumn, and not always heat at those times. The fruit are noble at dessert, and, when well done, good in quality. Make no attempt to remove the leaves until they part readily from the trees by shaking the trellis. Cut out all the wood that has borne fruit, and all superfluous growths. Do not allow the soil to become very dry, but, if necessary, give water to moisten the soil down to the drainage. Keep the house cool by free ventilation, clearing away the leaves as they fall. Trees that grow too luxuriantly should be root-pruned and lifted whilst the leaves are upon them; but the wood being unripe, they must not be lifted until the leaves have for the most part fallen, or the unripe wood will shrivel and die. If the wood does not ripen well, turn the heat on by day with moderate ventilation, and shut it off in the afternoon, so as to have the pipes cool by night, and then open all the ventilators, unless frost prevails, when ventilate according to circumstances, for a sudden collapse of the foliage is detrimental to the tree's health.—ST. ALBANS.

### Kitchen Garden.

**CELERY.**—Further growth will not be made by the main crops of Celery, especially those which are now of large size, hence the final earthing should be carried out, if not already done. Plenty of soil should be worked round the plants, drawing the stems closely together to prevent it entering the hearts. Bank the soil well up towards the tops, leaving about 6in of leaves or tops visible. The later rows of Celery should be earthed in proportion to their size. For the present it is not advisable to carry the soil above the heart leaves. In mild weather the plants will advance in size, but growth is very slow now, and small plants will never become large; but if short and sturdy plants are well blanched the quality is good.

**SEAKALE.**—The foliage of Seakale having now all died down, it is necessary to rake it off the beds. Then lift a portion of the roots, and select the best and strongest central main roots with a well developed crown to each, and lay in moist soil for the purpose of using them for forcing in a short time. This is better than waiting until they are actually required. In trimming the roots for forcing purposes there will be a number of the slenderer portions which are of no present use. They may, however, be prepared as planting roots. Cut them to a uniform length of 6in, utilising all those of the thickness of the little finger. In order to distinguish the top from the bottom, cut the former straight across and the latter slantingly. Lay them in a moist soil, or sand, in a sheltered place outdoors, and by April a ring of growth will be forming, and they may be planted.

**CAULIFLOWERS AND EARLY BROCCOLI.**—If any heads of Cauliflower still remain it will be advisable to lift the plants and place under shelter. Pull up and destroy the old stumps. Early Broccoli which may be just beginning to form heads, must have these protected from heavy damp and frost. This may best be done by breaking some leaves over them, though plants with finely developed heads, or promising such, may be lifted and laid in under cover.

**BEET.**—Recently lifted Beetroots, having now become dried, they may be stored in a cool dry place, between layers of dry soil or ashes. Arrange the crowns outwards. When stored in damp material young rootlets are encouraged, which in time become very strong, and are detrimental to the quality of the roots. In the event of all the roots not being lifted, it is advisable to do so before severe frosts occur.

**CARROTS.**—These roots are better out of the ground and placed in a cool store. It is not important to dry them so thoroughly, but they must rather be on the dry side than the wet side, as if stored in heaps for any length of time rootlets will be emitted.

**POTATOES.**—The stores of tubers having now become to a great extent dry, should be examined for any indications of disease in the tubers. This is important, as any infected specimens will soon damage others. Remove the small tubers, and at the same time a selection for saving for seed may be made. Tubers intended for table use must have light excluded from them, and additional covering given when severe frosts are imminent.

**PARSLEY.**—Pick out all yellow leaves and unsuitable foliage from the Parsley bed. The beds of autumn seedlings should be kept clear of weeds. A few strong plants may be potted for taking under cover in severe weather, but the beds of plants must be also protected.

**WINTER GREENS.**—Savoy, Brussels Sprouts, Borecole, and Broccoli, having a proportion of yellow leaves hanging about them, should have these cleared off, and the plants made tidy for the winter. Weeds, which have grown luxuriantly and revelled in the damp, should not be allowed to choke the plants and disfigure the ground.

**TRENCHING GROUND.**—Some portion of the kitchen garden should be deeply trenched each season. Where the ground has not been moved for years to a fair depth, bastard trenching, which consists of deep digging without changing the position of the spits, should be adopted. This obviates bringing inert soil to the surface and burying the best.—E. D. S.

## Trade Notes.

### Roses; The "Dean's Collection."

Referring to our remarks on page 397 in the notice of the Very Rev. the Dean of Rochester, Messrs. B. R. Cant and Sons, Colchester, write to say that they alone supply the selection termed the "Dean's collection."

### John Russell, Brentwood.

We have received the following letter from the Essex Nurseries, Brentwood:—"Permit me to point out that in your notice of the National Chrysanthemum Society's great show at the Palace, you have credited Mr. John Russell, Richmond, with the display of a hardy group, whereas it was my exhibit, 'John Russell, Brentwood.' The firms are now independent of each other. I trust that you will kindly correct this.—J. RUSSELL."

### Timber Growing on a Commercial Scale.

Messrs. Dicksons and Co., of 1, Waterloo Place, Edinburgh, in sending us their catalogue of forest trees and other nursery stock, draw attention to their remarks made on the first few pages of the catalogue. All who secure one of these catalogues can read the letter in extenso, and we may only notice in this place that Messrs. Dicksons are eager to see the propositions made by the recent Departmental Committee on Forestry made effective. Great Britain has twenty-one million acres of waste or idle land, and their afforestation is a matter of "grave national concern." The firm also refer to the Common Larch "canker," and they suggest as a substitute to the Common or European Larch the Japanese Larch (*Larix leptolepis*). This is a quick and vigorous grower, and quite hardy.

### Leek Show at Kelso, N.B.

The firm's annual open Lyon Leek Competition took place within the premises of Messrs. Laing and Mather (incorporated with Stuart and Mein), and was again an unqualified success. There were nine prizes offered, and the conditions were that each exhibit should comprise three Leeks, grown from seed purchased from the firm. Exhibits were sent in from all parts of the country, even from as far south as Devonshire and Cornwall. In all there were thirty-six lots shown, and they made a very attractive display, the quality and size of most of the exhibits testifying to the excellence of the "Lyon" variety. The first prize lot, shown by Mr. Hood, Dryburgh, contained three remarkably good and evenly-grown Leeks, the blanched portions of which were nearly 18in in length, being at the same time close and fine in texture. The second prize lot, belonging to Mr. A. J. Harrison, Lauder, although not so evenly drawn as the first, were also very fine, and one of the three, which had fully 18in of blanch, attracted considerable attention. The following were the prizewinners:—1, R. Hood, Dryburgh, St. Boswells; 2, A. J. Harrison, Lauder; 3, W. Moore, Nunwick Gardens; 4, John Wightman, Eslington Park Gardens, Northumberland; 5, W. Hodgson, Prudhoe; 6, James Steel, Kelso; 7, Thomas Fairbairn, Benrig Gardens, St. Boswells; 8, Thomas Watson, Cannongate, Alnwick; 9, R. T. Rae, Sunlaws, Kelso; specially commended for quality, J. M. Burkett, Dunfermline. The judges were Messrs. Charles Street, Floors Castle Gardens, and William Chaplin, Springwood Park Gardens.—("Kelso Mail.")

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**GARRYA ELLIPTICA FRUITING** (J. S.).—It is comparatively rare for *Garrya elliptica* to produce fruit, as it is dioecious—that is, bears the male and female flowers on different plants, and the male plant is the one chiefly grown. Are you sure that your plant is the true *G. elliptica*?

**BOOK ON VEGETABLE GROWING** (Juvenile).—"Beckett's Vegetable Growing for Exhibition," published by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, E.C., price 3s. 6d.; or if you require a smaller work, "Vegetable Culture," by A. Dean, F.R.H.S., published by Messrs. Macmillan and Co., London, price 1s.

**ACACIA DRUMMONDI: BUDS FALLING** (Puzzled).—"Would you kindly tell me through the medium of the Journal the reason of *Acacia Drummondii* dropping the buds? It is in a cool house, potted in peat and sand, and the roots are apparently healthy."

[We cannot explain the cause other than that the soil in which they are growing must have been too much dried at some recent date. This might cause a sudden change in the constitution of the plant.—Ed.]

**CROSS BETWEEN RASPBERRY AND BLACKBERRY** (O. J. D.).—You allude to the Loganberry, which is a cross between a Raspberry and a Blackberry, the former being the seed bearer, or a Raspberry crossed by a Blackberry. The fruit of this is borne in clusters, and is long and dark in colour, with a sharp acidity when half ripe, but of a rich flavour when black, when it is fit for the dessert. It bears very freely treated like a Raspberry. The Loganberry is shown natural size in the *Journal of Horticulture*, October 8, 1903, page 329.

**CROSS BETWEEN RASPBERRY AND STRAWBERRY** (Idem).—You may secure plants from any of our advertisers who are fruit growers. You will find the hybrid a dwarf growing (1ft) subject, with Raspberry-like foliage. It has a bushy habit. The fruits are like Strawberries, very gritty (from the seeds) and insipid. It is somewhat ornamental, but will not furnish a useful dessert.

**CHRYSANTHEMUM RUST** (D.).—Yes, the fungus is bad in many places, and has evidently come to stay. So far as we know the best preventive treatment is spraying at intervals, dating from the growth of new leaves, with potassium sulphide solution, which not only destroys the rust spores, but also those of other fungus pests that attack Chrysanthemums. Removing leaves or plants showing the slightest trace of the disease is excellent practice. The fungus, now recognised as *Puccinia Chrysanthemi*, is as commonly seen in the rust stage as *Uredo Chrysanthemi*, as first stated in the *Journal of Horticulture* in 1897, and shown in the number for October 13, 1898, page 285, has no connection with the fungus found on Hawkweed (*Hieracium*), being more closely related to, if not a form of *Puccinia tanacetii*. Where the disease has existed it is very important to destroy all leaves likely to produce or contain teliospores, otherwise a recurrence of the disease is practically certain. The uredo form continues in the living leaves of plants grown under glass during the winter, hence a careful look-out for the fungus must be constantly kept, and the affected leaves collected and burnt before the pustules burst and liberate the spores.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (S. B.).—1, *Pelargonium citrodorum*; 2, *P. tomentosum*; 3, *Reidia glaucescens*; 4, *Croton* (*Codiaeum*) *Reedi*. (F. J. T.).—1, *Crocus damascena*; 2, *Rudbeckia digitata* (late flowering); 3, *Chrysogonum virginicum*. (B. P.).—1, *Muehlenbeckia varians*; 2, *Magnolia grandiflora*; 3, *Kadsura chinensis*. (W. L.).—1 and 4, *Lastrea filix-mas* (male Fern); 2 and 3, *Lastrea dilatata* (Broad Buckler Fern); 5, *Polypodium vulgare* (common Polypody); 6, *Arbutus Adrachne*.

## Trade Catalogue Received.

Messrs. W. Clibran & Son, Altrincham.—*Chrysanthemums*.

## Weather Notes.

### Devonshire.

I am in receipt of a letter from a friend at Westward Ho (Devon), and from its contents it would appear that even in that most favoured part of the kingdom the evil effects of the past weather have been felt. He says, "Rain, rain every day, and plenty of it." He also gives a graphic account of the great gale in September, which must have been decidedly more severely felt there than in Scotland. He says it had a curious effect upon the foliage of trees. The leaves afterwards turned almost black, and had the appearance as if burned by fire, and after a few days began to fall off, so that all the trees were practically bare by the middle of October. "And now," he says, "a good many are springing into bud again, and we have a Pear tree in full bloom, with Lilac trees all budding." My friend also says they had little or no fruit in the garden, though it is full of fine bearing Apple and Pear trees.—D. C.

### October Weather at Belvoir Castle.

The prevailing direction of the wind was South, total thirteen days. The total rainfall was 5.65in, this fell on twenty-nine days, and is 2.57in above the average for the month. This is the greatest amount recorded for one month since October, 1892, and the greatest number of rainy days recorded here for one month; details previous to 1877 are missing. Barometer (corrected and reduced): Highest reading, 30.078in on the 18th, at 9 p.m.; lowest reading, 28.947in on the 12th at 9 p.m. Thermometer: Highest in the shade, 64deg on the 1st and 3rd; lowest, 33deg on the 24th; mean of daily maxima, 56.45deg; mean of daily minima, 44.67deg; mean temperature of the month, 50.56deg; lowest on the grass, 31deg on the 24th; highest in the sun, 116deg on the 3rd; mean temperature of the earth at 3ft, 52.80deg. All the mean temperatures are considerably above the average. Total sunshine, 92 hours 50 minutes, which is nearly two hours above the average for the month; there were four sunless days. There has been no frost here this autumn to destroy tender plants, and Dahlias, Heliotrope, and others are now (November 3) full of flowers outdoors.—W. H. DIVERS.

Damp, misty weather has been the feature of the past week, with small quantities of rain on six days.

### Weather, Roses, and Bees at Newton Mearns, N.B.

Since I wrote a fortnight ago the weather has not improved. The last week of October gave us an additional figure to the month's rainfall. From figures kindly supplied to me by my

good friend Mr. Lyon, of The Gardens, Pollok Castle, I learn that the rainfall for October was 10.54in, which seems to me to be an extraordinary fall. I also learned that the largest falls were registered on the 5th (0.89), 7th (1.15), 15th (0.58), 16th (0.50), 17th (0.34), 25th (0.53in), and 28th (0.56in) respectively. There were only two dry days in the month, viz., 10th and 18th. With the approach of November, it was hoped that a change would set in, but so far no improvement, sunshine and rain alternately. The harvest now is a word of the past, although there is yet a considerable amount of grain out in the fields, but what is it like? Rubbish. It will possibly do for manure. Although the farmers here have felt a little loss, yet away further North I learn that losses to the extent of thousands of pounds have been caused. Not for many years has such a time been experienced.

The gardens and fields are still looking fresh, but the leaves are now well off the trees. The ground, however, is "water-logged," and any alteration to be made now will require to be delayed. Roses that were ordered have arrived from the nursery, but it will be some time yet before planting can be commenced. There are still a good few Rose blooms in the garden: Hayward, Gén. Jacqueminot, Helen Keller, and Piganeau are specially fine; while Testout, Grant, Grolez, and Antoine Rivoire are exceptionally pretty for the time of year. Rivoire is under glass globes, which is the only way a good bloom can be secured in damp weather. The same remarks apply to Bessie Brown. A look round the apiary on Saturday last satisfied us that stores were plentiful, and with the protection of rainproof covers the bees should winter well.—N. R., November 14, 1903.

## The Agricultural Census of 1901.

We should perhaps, say, the census from an agricultural standpoint. We are now in a position to know exactly how we stand in respect to the numbers of the employed as against this time fifty years ago. We have felt the difficulties of the labour question, and we have seen on every hand what a lack there has been of suitable workmen. At the present time the labour question is, to many of us, of vital importance, and we do not know where to turn to find hands to get us through the press of work before the severe weather stops all but the most urgent work on the land. With the increased demand come larger wages, and just at a time when the farmer can ill afford an extra halfpenny. Women are eagerly sought after, and we cannot but think that 2s. for a day beginning at 9 a.m. and lasting till 4, is a good wage. Indeed, to-day we saw women well on towards their homes at 4.10. Boys and girls just out of school ask, and get, 1s. 8d.; and still at these wages both women and young folks are scarce. Many Irishmen come over for the two harvests, that of corn and Potatoes; but the season has been so delayed that they will stay with us no longer, and are off in flights like the swallows.

Mr. Druce, of the Farmers' Club, has brought together some figures that he finds in the census returns, and which show clearly how we stand. He takes fifty years, and we see how the population, as a whole, has increased, and in some sections the increase has been very little; in others there is but a decrease to record. In 1851, out of a total population of eighteen millions, two millions were of the agricultural class. In 1901, out of a population of 32½ millions, rather more than one million are agriculturists; or, to put it very plainly, that all may comprehend—In 1851, one person out of every nine was employed in agriculture, as against one person in thirty-two in 1901. The number of labourers has diminished even more, for in 1851 we find 1,250,000, as against 609,000 in 1901, less than half!

Now this shortage cannot all be accounted for by the introduction of machinery and the turning of arable land to grass! From 1891 to 1901, the agricultural population has decreased 15½ per cent. The urban districts have increased 15½, and the rural districts have increased three per cent.

(N.B.—The rural and agricultural population must not be confounded: they are not one and the same thing, for the country is the retreat of (1) those out of business, (2) of those who go to and from their work, (3) of miners and other workers that are not of the agricultural class at all.

The number of farmers proper have fluctuated a good deal during the fifty years. In 1861–71, their numbers increased as compared with '51; they went down in '81 and '91, touching their lowest point in '91, and they have risen again in '01. This, and the fact that we find so many relatives of farmers as assistants, points to the fact that many of these farmers are holding lessened areas, and are employing relatives rather than outside help, i.e., they are doing the work within themselves, and forming a class of men who are, perhaps, the most hard-working of any community. Probably in many instances the farms are their own, and it is only by the means above indicated that they are able to keep their heads above water. We know many instances of sons and daughters working for nominal wages, or perhaps, barely more than their keep, just because they have honest pride enough to wish to keep the bit of land intact. Farm bailiffs are on the increase during the last ten years. The name "farm bailiff" reads differently in various neighbourhoods. "Farm Bailiff" proper, ranks rather above a "foreman," and the name implies a superior class of men who are managing land under the landlord, rather than the tenant, and this would suggest that landlords have a good deal of land in their own hands at present. We hardly think this is the case; certainly not in the north of England.

Mr. Druce thinks the drop of 22 per cent. of labourers and shepherds during the last ten years may be accounted for by the fact that the census was taken during the period when we had so many men (reservists) out with the forces in South Africa. We do not think that would affect shepherds. We do think that on many farms, from motives of economy, the foreman and shepherd are combined in one person. The percentage of arable laid down to pasture during the like period (ten years) has been six per cent. The tendency of making small farms or letting farms to men in a lower grade of life than formerly all tends to the lessening of the demand for labourers. These men have to keep down expenses to the lowest point, and to do so they first cut off superfluous labour (or what they think superfluous), and then cut off all the manurial agents they dare. There is very little intensive farming: now the farms are run more on the American system, and are all for utility as against beauty and mere neatness. We are sorry for this, for the neat picturesqueness of an English farmer is very pleasant to the eye, and it is what strikes a foreigner so forcibly. We have sometimes been inclined to think certain "faddy" men have run up their labour bill too much. They could still have had things well done had they paid more attention to details themselves; insisted on more punctual arrivals in the morning, and not overlooked early departures. There is much more time and money lost in this way than can be easily calculated. Such irregularities are not for one moment allowed in factories or mills: it is only the easy-going farmer who gets victimised, and he has but himself to blame for much of it.

We see the farmer is blamed for his apathy in not giving more attention to the higher branches of dairy work. The better class of cheeses—for instance, those that we find at the good hotel or the fashionable club. The irony is that we let the foreigner seize and hold this market, and we hardly see how it can be otherwise till this question of agricultural population rights itself a little. Cows may be fed and milked, and the milk despatched to some great centre, and in this we see the minimum of labour with the maximum of profit: but it comes about that if the farmer wishes to convert this milk into cheese he is brought face to face with a great difficulty. Unless his own family will undertake the work, it must go undone. True, the rush of work is during the summer months alone; but it matters little when it is, if he can get no one to do it. We know ourselves of a case where all the summer milk was turned into most excellent Stilton, but this was only because the mistress worked like a slave herself, being in her dairy daily by 6 a.m., if not earlier. She could get no servants to help, and, by-and-bye, had to give it up, the strain being too much, taken in connection with her other household duties. Why cannot some of those young women who flock into towns and make indifferent dressmakers and badly paid shop assistants turn their hand and attention to this industry? But they won't, preferring anything to a country

life. It is a sort of madness we cannot understand, and we fear it is growing.

We have seen this year, for the first time during a long life, the meets of various hounds postponed, not on account of the frost, but because the ground was too wet for sport, and there was imminent danger of harming the crops. This gives some idea of the universal deluge, a deluge unequalled certainly during the lifetime of this generation. Shall we need to say a word in favour of the farmer? Do all that "ride to hounds" choose their road as carefully as possible? We have had occasion to remark that on soft land a horse's foot does positive harm in beating and solidifying, and this on bare fallows; but must the harm be on fields of freshly sown Wheat or over young seeds? It is not one solitary horseman, but the "fields" of to-day are so immense, and, we fear, many of them come only for a gallop. There are acres of Mangolds yet unpulled, and though the Mangold is hardier than of yore, it is not improved by a great piece being punched out of its side by an iron shoe. If men would only believe it, "the going" is much easier on the headland, and the damage done far less. We hear a whisper that the fair sex is the most to blame, and if so, we fear that these words of ours won't meet the eyes of the chief delinquent.

As to fences, and the damage done to them (if we dare make the suggestion), a few hand gates might do much to obviate this difficulty. Need we say that we hope all strands of dangerous wire are now removed from along the tops of the fences? On whom this duty and expense falls is still a debated question; but we think that as hunting is the sport of rich men, and the present-day farmer is a poor man, the expense should come out of the hunt fund. We were amused the other day by the statement that fox-hunting was the cause of the decadence of poultry rearing, and the reason of our great lack of eggs! "Credat Judæus." If there is a real and true desire to keep poultry, foxes will prove no bar. We whisper it, but we believe the fact implicitly, that foxes are often blamed for the destruction of poultry that is yet to be hatched!

### Work on the Home Farm.

Although we have had very little rain since our last, the land has not dried much. We have had three nights' frost, rising from three degrees of frost to eight, and though it added to the anxiety of Potato growers with crops still unlifted, it would probably do considerable good. Wet pastures will now be safer to run sheep on as regards the danger from liver fluke, though the animals will be better on sounder land until after Christmas if it can be managed.

We notice a few Potato pies being soiled up. We hope there may not be many bad ones, or the closing-up now may be impolitic. No doubt the frost has given a warning note, but we seldom have frosts so early which are severe enough to go through a good covering of straw batts. Hands are too scarce at present to allow of turning the crops over and taking the bad out.

We hear of fifteen tons of Evergood per acre being grown, and a portion being sold at £9 per ton. This is an eight-acre field. We also hear of three bad Northern Stars at one root, and of a purchased 2lb lot containing one very bad one. These are facts we can vouch for.

We are Wheat sowing, but it is very heavy work for the horses in the drill, which we prefer to use if possible. Some farmers are thinly ploughing their seed Wheat in after Potatoes, but they must be leaving many Potatoes beneath which a deeper ploughing would have recovered.

A neighbour is taking Carrots up—a fine crop, which he sold at £26 per acre. Carrots were such a drug last year that very few people have grown any; consequently they are now selling very well. Next year it will be a case of enter Carrots, exit Potatoes.

We shall defer ploughing fallows down for winter until the water has had greater chance to drain away, and shall find occupation for the horses in carting manure on to the seeds. There will also be some work in delivering Barley to the railway. Winnowing, or screening the corn, is occupying the time of some of the hands. This is work that must not be slipped, if we are to keep a good name with the buyers on the market. A "small" farmer showed us the other day a delivery order for some Barley which he had received from the purchaser. "Please dress well," was heavily underlined. That Barley was weighed at the machine tail, and never dressed at all.

Cattle are all up and on strictly winter keep. Roots are good, but hardly ripe enough. The cattle, however, seem to thrive, which is, so far, satisfactory. We shall have to procure a supply of poles and stakes, as the time for repairing fences is near at hand.

## PLANTING SEASON

## PAULS' ROYAL NURSERIES

WALTHAM CROSS, HERTS.

12 miles from London. South Entrance four minutes' walk from Waltham Cross Station; West Entrance three minutes' walk from Theobald's Grove; both Stations on the Great Eastern Railway.

## SPECIALITIES:

**ROSES** in all forms, from open ground and in pots. Gold Medals in 1903 from Royal Horticultural and Royal Botanic Societies.

**FRUIT TREES** for the Orchard, Garden, and Forcing House. Hogg Memorial Medal, 1901.

**HARDY TREES** for Streets, Parks, and General Planting. Silver Medal from Royal Agricultural Society of England.

**SHRUBS**, both Evergreen and Deciduous.

**CLIMBING PLANTS**, Hardy and Greenhouse.

**RHODODENDRONS, CAMELLIAS, & AZALEAS.**

**HERBACEOUS PLANTS** in great variety.

**BULBS and SEEDS**, and all Garden Sundries.

PRICE LISTS ON APPLICATION. INSPECTION INVITED.  
Upwards of 1000 Medals, Prizes, and other Awards at leading Exhibitions during the past 42 years.

SOLE POSTAL ADDRESS—

WM. PAUL & SON,  
WALTHAM CROSS, HERTS.

Rose Growers by Appointment to His Majesty the King.

## CHERRIES—A SPECIALITY!

Awarded Silver Banksian and Silver Gilt Knightian Medals for Collections by R.H.S.

Our collection is complete (over 50 varieties). Thousands to select from, very strong and well rooted. Standards from 12/-, 15/-, 18/- doz.; Dwarf Maidens, three and more shoots, 9/-, 12/- doz.; Dwarf Trained, 2/-, 2/6 and 3/6 each; Dwarfs, two-year heads, suitable for pyramids, 10/-, 12/- and 18/- doz.

LIST FREE ON APPLICATION.

W. RAY &amp; CO., Nurserymen, TEYNHAM, KENT

## GRAPE VINES in POTS

Extra Strong Fruiting and Planting Canes  
in all Leading Varieties.

## FIGS IN POTS

All Leading Sorts.  
Bushes and Fan-trained for Walls.

## DICKSONS Nurseries CHESTER

## 1500,000 BULBS.

Spanish Iris, Yellow, White, and Blue 7/6 per 1000.  
Crocus, all colors 5/6 per 1000.  
Sir Watkin Narcissus 5/6 per 100.  
Horsefieldii 5/6 per 100.  
Trumpet Narcissus 7/6 per 1000.  
Glory of Leiden Narcissus 6d. each.  
Madam de Graaff 3/6 each.  
Sweet Scented Pheasant Eye Narcissus 5/6 & 7/6 per 1000.  
Mixed Narcissus 5/6 per 1000.  
Double Daffodils 5/6 & 10/6 per 1000.  
Tulips, Mixed (choice) 2/6 per 100.  
Single Lent Lilies 3/6 per 1000.  
Snowdrops 5/6 & 7/6 per 1000.

THURSDAY, NOVEMBER 26, 1903.

## British versus Foreign Apples.

WE in this country are fortunate in being able to get large supplies of Apples from foreign lands to augment our own crops. Even in plentiful seasons we could not do without them, and in years like the present, when our own crop is almost a failure, we have reason to be thankful for the huge consignments of brightly coloured samples which come to us from Canada and the United States. This much is admitted by the majority of fair-minded individuals. Still, it behoves us all to do what we can to aid Britain in supplying a much larger share of her own requirements.

In this connection there is one point which needs to be constantly kept to the front—viz., the superiority of well-grown British samples in regard to *flavour*. How is it that we are continually seeing paragraphs in the press asserting that the Apples grown in this or that county are the finest in the world? The statement is a most misleading one, and will not survive a critical test. It is generally admitted that foreign Apples are, as a rule, brighter in colour than those grown in this country, and the average samples are usually larger; but they gain these advantages entirely at the expense of *flavour*. No matter whether we take the cooking or dessert kinds, there is a great advantage on the side of the home grown article. One cannot understand anyone preferring the foreign samples when cooked to the best English kinds, nor the dessert ones when compared with Cox's Orange Pippin, Ribston Pippin, and Blenheim; and when that fine new variety, The Houblon, gets more plentiful, it will probably make as great a name as the three previously enumerated have done.

Those who know what good Apples are will invariably select the best British kinds in

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

preference to the best from other lands. It is necessary, however, to educate the masses of our countrymen in regard to what are the best flavoured kind, as far too many make their purchases by appearance alone.

Although we have had a particularly unfavourable year for Apples in those places where cultivators have been fortunate in securing a crop, the fruit has been good, with the exception of colour, which has been more deficient than usual. In favourable seasons, however, there is not much fault to be found with the colour of British Apples. Where the best varieties are grown, and good attention given, many growers who have taken up fruit growing in a serious way, treat their trees well, and pay the necessary attention to packing and grading the fruit, but there is yet much to be done to induce the majority of cultivators to do these things. Those who have produced good samples this year have had very little difficulty in disposing of them without sending to the open market. The rubbish in the markets is the produce of rough-and-ready growers, and therefore is seen at a great disadvantage when compared with the good foreign samples. It is simply a case of comparing our *worst* with the foreign *best*; but when Britain shows her best she is not behind in appearance, and is infinitely ahead in the chief point—flavour. It is, therefore, not very wide of the mark to say that the British Apples are the *best* in the world.—G. C.

## Hydrocyanic Acid Gas Fumigation.

Some useful pointers on the use and effects of this recently suggested gas for fumigation purposes, have been given in the "Florists' Exchange," a New York paper. The gas has been, and doubtless is now, to a small extent, used in conservatories and fruit houses in Great Britain and Ireland, and the *Journal of Horticulture* described the methods of operation, the materials and quantities used, when reviewing Professor Johnston's book on "Fumigation Methods," page 379, May 1, 1901. We print two of the letters from our American contemporary:—

No. 1.—"I used one gallon earthen jars for the work, and only one jar to every 3,000 cubic feet. The jars were filled with one quart of water, one quart of sulphuric acid, and placed in the paths at different parts of the houses. Next I laid a stick across the path, above the jars, having it rest on the benches, thus being about 3ft from the ground. The cyanide of potassium was put up in 5-oz. packages (exact weight); these packages were tied on strings sufficiently long to reach the next jar, and when all were ready I again went to the further one, opened the package a little on one end, hung it on the stick just above the jar, and let it down, after I had reached the end of the string, and so on until all the packages had been dropped. Of course, the dropping of the cyanide of potassium must be done quickly, as the fumes are very dangerous to man and beast. The doors and ventilators must be closed tight. The fumigation was done at six o'clock at night, and the ventilators were opened at seven o'clock the next morning. The white flies were all dead, but I noticed a few mealy bugs, which were not hurt at all.

"The houses contained the following plants: *Asparagus plumosus* and *Sprengeri*, *Acalyphas*, *Lantanas*, *Rex* and flowering *Begonias*, *Coleus*, *Latania borbonica*, *Kentias*, twelve varieties of Ferns (including the Boston, Sword and Maidenhair), *Marantas*, *Selaginellas*, *Hibiscus*, *Heliotrope*, *Cissus discolor*, *Impatiens Sultani*, *Oranges*, *Fuchsias*, *Abutilons*, &c. The Sword Ferns were planted on the bench. The path is very narrow, so that the fumes from one jar came directly up against some of the leaves which were overhanging. The tips of the leaves were very slightly hurt, but 3ft from the jar there were no signs of any damage whatever. The *Asparagus plumosus* were in 3in and 4in pots, and were very close to another jar. These plants were hurt a very little also; but the damage done was so small that a week afterward we could not notice it. The remainder of the plants came out without the slightest injury. There is no doubt but that many plants will stand a stronger fumigation, and I hope that we shall hear more of it in the future, as I think it is a very valuable remedy. My first experiment was an entire failure, as the cyanide of potassium I received from our local drug store did not have any strength, and must have been old stock."

No. 2.—"In the first place, I should strongly recommend all those who are intending using the gas to study the subject thoroughly first. The old adage, 'A little knowledge is a dangerous thing,' is especially true in regard to this method of fumigation. I should advise your inquirers to purchase Professor Johnston's book on 'Fumigation Methods' (Orange Judd Co., New York, 3s. 6d.), wherein there is a lucid description of the gas fumigation, and study it well before attempting to use the gas on a large scale. An incomplete knowledge of the subject once caused me to ruin a house of Violets. I thought I had studied the subject thoroughly, but forgot the simple precaution

of waiting until night before I generated the gas. Regarding the fumigation of a vinery, last winter I successfully fumigated one, with no apparent ill effects to the Vines. The operation was done in winter, when the Vines had been cleaned and were perfectly dormant. The quantity of cyanide of potassium used was the same as recommended for Violets—0.15 gram per cubic foot. The house was kept closed for half an hour. On examination the next day all the mealy bugs visible were dead, but this did not rid the vinery entirely of the pest. I fancy the gas has no effect on the eggs of these insects, so fumigating with the gas only kills the adults; and if this method were resorted to to entirely rid a vinery of the pest it would require several fumigations, at different times, to thoroughly eradicate the insect. I also had experience last winter in fumigating a Peach house for San Jose scale, with dire results both to the scale and the fruit crop. The quantities used were the same as for the vinery, and fumigation was done in December. Twenty minutes was allowed for the gas to act. On examination next morning one or two fat mealy bugs were located on the trees, appearing as if nothing had happened. I was not prepared for the results which followed this fumigation. When the house was started up in the usual way, and with the usual treatment, neither fruit nor shoot buds developed naturally. They seemed to have been retarded about six or eight weeks; most of the fruit buds dropped as the flowers opened. What flowers remained on and expanded fully could not be fertilised, even by hand. Not one tree in the house could be induced to set fruit. The whole thing would have been a miserable failure, but for the fact that the San Jose scale was entirely checked, and on examination of the house to-day—ten months since the fumigation—no trace of the scale is to be seen.

"This experience with the Peach house has puzzled me very much. The very fact that some live mealy bugs were discovered the morning after fumigation would show that there was not an overdose of the gas. The buds were perfectly dormant, as the operation was done only a few days after the last leaves had fallen. The house contains both Peach and Nectarine trees, and if anything the Nectarines suffered the most. One tree of Early Rivers took about six months to recover and get a decent growth. I am of opinion that much more experimenting has to be done before the hydrocyanic acid gas may be safely recommended for general use."

## Trans-Atlantic Echoes.

At the monthly meeting of the Rhode Island Horticultural Society, held on October 21, at Providence, R.I., the principal event of the evening was an address by J. H. Hale, president of the American Pomological Society. He spoke in part as follows, and following the above leader, his words will have treble significance to British cultivators. Let patriotism stir us to action.

"In the old days of this country our forefathers brought fruit seeds from England and planted them, and from the result of this planting other trees were obtained, until gradually the number of trees grew very large. The object of this planting was primarily to get something to drink—to supply the cider barrel—and the bounties paid for the propagation and improvement of fruit were entirely with this end in view. From this growing for the cider barrel entirely extended the small fruit gardens for family supply. It is only within the last half-century that commercial fruit growing has been taken up in New England, and it is still only a side issue in the majority of cases. The average land owner of New England and of Rhode Island has failed to grasp the opportunities existing in this section of the country.

"Here in New England we have the finest markets in the world right at our doors. We are right on the Atlantic coast, and have the best facilities of any location in the world for supplying the great English market. Practically all the fruit used in London and vicinity has to be imported, and New England is the nearest available point where this fruit can be grown. To carry on horticulture successfully it is necessary to follow out all its branches in a scientific way. In the first place it is necessary to trim the trees in order that the fruit shall reach its highest state of perfection. Then care should be used in harvesting the fruit, and it should not be picked until it has reached its highest state of perfection. It should be carefully graded and sorted into sizes, and should be placed in the most attractive packages possible, and should be always sold in good weight. We have been using too large packages for our fruit, and the next thing to do is to adopt the family package, so that the fruit goes directly to the consumer without the package being broken by the middleman. With the extension of the electric car service through the rural districts the facilities for the delivery of fruit have been largely increased, and when we get the parcel post, which is sure to come in time, they will be still further increased. The land in New England is cheap, the opportunities are all here, and it only waits for the enterprising man or woman to take advantage of them."

**Cypripedium Godefroyæ leucochilum.**

The section of Cypripediums to which this, and bellatulum, niveum, concolor and others belong, displays some of the choicest flowers in the genus. They agree in requiring special treatment—an intermediate temperature, a compost of broken pieces of lime rubble and tufa stone, and plenty of daylight. It is therefore necessary to have them near to the glass. Place them on a shelf at end of an intermediate or warm house, away from the possibility of draughts. They are best kept almost perfectly dry all winter, but must have an abundant water supply when in growth. A genial, circulating air around them is desirable. They may be grown in hanging pots. *C. Godefroyæ* is a natural hybrid from Siam, the parents being *niveum* and *bellatulum*. Its variety (which we figure) differs in having an unspotted lip, the hybrid type being purple-spotted on lip and segments, over white. They flower during the early part of summer. Anyone desirous of more exact cultural hints with regard to the section must watch the calendarial notes weekly, and on page 347 of our issue for October 15, 1903, there appeared a note taken from the "Orchid Review," which explained the methods practised so successfully for *C. niveum* by Mr. Mackay, grower to Mr. Chamberlain at Highbury.

**Cypripedium insigne in Small Pots.**

Speaking of plants, he has seen flowering freely in small pots. "E. M." p. 458, notes how useful they are, and I can thoroughly agree with him. It is a wonder that such plants are not more commonly grown, as they are certainly much more profitable than the large, ungainly, and often unhealthy specimens. What "E. M." does not appear to have noticed, however, is the fact that the plants, with their roots crowded tightly together in small pots, are really the most free flowering. It is quite a mistake to allow this old and useful plant too much pot room, as this causes a free growth, but few flowers. The same thing applies to all the varieties of *C. insigne*, as well as *C. Leeannum*, and other of the hybrids having *C. insigne* as one parent.—H. R. R.

**The Week's Notes—"Firing" and Ventilating.**

Mismanagement of the heating apparatus has a good deal to answer for in producing a dry, unhealthy heat in the houses, leading to insect attacks and general ill health of the plants. Just now we frequently have fine mornings following very cold nights, and the inexperienced stoker, on finding the temperature somewhat low in early morning, fires up rapidly, so that by the time the sun is shining on the houses the pipes have become very hot. Owing to the large amount of fuel in the boiler, it is quite impossible to cool the pipes, and a waste of fuel is added to the injurious dry heat. Under the circumstances named it is better to fire sharply, but keep a thin fire, so that when the sun reaches the house the dampers may be closed and a little ashes and small coke or coal put on to keep the fire alight until more heat is again required in the afternoon. In dull weather, of course, a certain amount of fire heat is needed all day; and with a chink of top and bottom air, will keep the atmosphere moving, and therefore constantly changing. The temperatures of the different compartments, of course, will vary according to the plants grown therein, but the above precaution is necessary in every case. Sometimes, in spite of all care, the houses get overheated, the sun suddenly appearing after an hour or two of cloudy skies.

Too often it is the custom in this case to run to the ventilators and open them widely to lower the temperature. This is quite wrong, and causes much injury to delicate plants. Instead, the house should be freely damped and only a moderate amount of air admitted. The temperature then gradually rights itself, and no sudden changes take place. Remember, too, that in the majority of cases Orchids are now at rest or approaching that condition, and fire heat sharply applied is harmful to them. Better by far let the house fall a few degrees when the mornings are very cold than press in a lot of fire heat. Covering the glass at night is a great help in maintaining a regular temperature; but the covering should be something easily removed.

When the ordinary summer blinds are run down at night in frosty weather they sometimes stick fast, and the light is kept out of the house until the ropes and pulleys thaw and are again workable. For the cool house especially a covering of dry garden mats is excellent, preventing radiation of heat from the glass and saving fuel. In this department especially a constant supply of fresh air is absolutely essential to the health of the inmates, and, whenever possible, the upper ventilators must be slightly opened. The wooden shutters in the walls (when provided) should never be entirely closed night or day, but a chink may be left on both in the warm and cool houses.—H. R. R.

**Hardy Plant Notes.****Crocus Scharojani.**

*Crocus Scharojani* is the first to bloom in autumn. It has recently reappeared from Armenia. It was first discovered in 1865, at a height of about 7,000ft, in the Caucasus, by Herr Scharojan, and was first flowered by the late Colonel Trevor-Clarke, of Welton Place, Daventry, in 1879. The following year it was flowered by Mr. George Maw, who figured and described it. It begins to bloom in the end of July and beginning of August, and those who appreciate the glorious display made by the Dutch Yellow Crocus of spring can well imagine how valuable this species may become to the flower garden in autumn. The colour is a bright orange.

The species often sold for it are *C. Olivieri* or *C. suterianus*. It has found its way into my garden, and I hope to have more to say about it again.—S. A.

**Bulbocodium vernum.**

Rich as is the wealth of bloom given by the species and varieties of *Crocus* in the early months of the year, most of us can yet find a welcome for other bulbous plants, even if of somewhat similar appearance when in flower. One of the most pleasing of these is *Bulbocodium vernum*, which is also commendable because of its shade of colour being unlike that of any of the Crocuses or other bulbous plants of the spring. It is also one of the very early flowers, and comes in frequently in the month of February to delight us with its pretty six-parted flowers of an attractive shade of a warm lilac, followed afterwards by its broadish leaves. The ease with which it can be grown is greatly in its favour, as it is perfectly hardy, and only requires to be planted in good soil, with the crowns of the corms about two inches beneath the surface of the soil. It prefers a good and rather heavy soil. Although it resembles the Colchicums and belongs to the same natural order, the Liliaceæ, and the same sub-order, that of the Colchicaceæ, Mr. Baker classes it with the tribe Uvulariæ, instead of including it with the Colchicæ, and it is more nearly allied to the Merenderas. Like many other

**Cypripedium Godefroyæ leucochilum.**

early flowers, it rises little above the soil, and is thus not liable to much injury from the weather, and a good clump or a mass is very pleasing in the early months, especially when associated with the Snowdrop, the Scillas, and such a flower as *Eranthis cilicicus*, which blooms later than the more plentiful *Eranthis hyemalis*. Those who like plants with variegated leaves will find the variegated-leaved form of *B. vernum* an acquisition, if they do not possess it already. Its flowers are prettily marked with creamy white and tinged with pink. It is a little dearer than the other, but is as hardy. These *Bulbocodiums* should be planted as soon as possible, and it will be necessary to watch for slugs just before they are coming into bloom. These pests are very fond of the blooms of the *Bulbocodium* from their earliest stages, and more than once the writer has been disappointed of the flowers by the ravages of such vermin.—S. ARNOTT.

### New Varieties.

For the benefit of those who have not the opportunity of inspecting the novelties as they appear, I am following my yearly practice for the benefit of Journal readers, so that cultivators, when reorganising their lists, as they annually must do, may have an up-to-date collection.

MARIE DU CROS is a decided acquisition to the already long list of Japanese varieties. The blooms are fully 9in in diameter, and are well "built" up in the centre, forming a perfect, yet huge blossom. The broad flat florets have a gentle droop. The point of each slightly curls upwards as they unfold. The colour is distinct and attractive, pale straw on the outer portion, gradually deepening to soft yellow in the centre. This variety originated from the same seed pod as Miss Mildred Ware, itself rosy cerise, which is a distinct proof of how difficult it is to control colour when raising new varieties, even in the Japanese section.

Mrs. J. DUNN belongs to the white flowered section of Japanese, and although they are so numerous, this variety is quite distinct. The most simple description would be to term it a white F. S. Vallis, so like that sterling variety is it in formation. The blooms are 7in deep and 8in in diameter, the centre thoroughly filled up, forming a handsome, full, rounded bloom. I do not remember the time when I was so impressed with two varieties as these, which are in the hands of Mr. Jones, of Lewisham, for distribution. The latter is a seedling raised by Mr. Carpenter; in height it grows 5ft, with thick, leathery leaves, and is a distinct rust-resister, which is a strong point in its favour.

Mrs. J. HADAWAY is a sport from Miss Mildred Ware. The blooms are fully 10in in diameter, and 6in deep. The colour is striking—pale yellow and fawn, with a faint rose suffusion.

BRIGHTNESS was well shown by Mr. Vallis at Plymouth, and is quite an acquisition to the bright coloured varieties. The blooms are quite 8in in diameter, closely built in the centre. The flat florets are of medium width, curling at the tip. The colour is a bright terra cotta with suffusion of yellow and a gold reverse.

MADAME HENRI DOUILLET reminds one much of Mrs. Mileham in formation; in colour it is a deeper rose.

JEAN CALVAT has narrow florets curling at the tip. The colour is striking—a rich red terra cotta with a golden bronze reverse.

SIR W. ACLAND has narrow reflexing florets which have an irregular twist. In colour it is striking—reddish bronze with a golden rose suffusion, gold reverse.

MISS STOPFORD.—This has medium, wide, drooping florets, creamy, white, deepening towards the centre as the flower unfolds.

COL. WEATHERALL is a deep bronze yellow with flat florets; a promising variety. Henry Perkins has this season been grandly shown, on many occasions, as much as 9in in diameter. The medium wide florets droop most gracefully. The colour is attractive—a rich, deep yellow, overlaid with bright chestnut crimson in stripes and suffusion.

Mrs. J. P. BRYCE (Godfrey) is a pure white, broad petalled variety, incurving loosely and building up a flower fully 6in in diameter; first class certificate as an incurved this season. Devonshire Hero, also incurved, rich orange yellow with pointed florets.—E. MOLYNEUX.

### Notes from South Wales.

One of the chief events of the year in Cardiff, namely, the Chrysanthemum Show, has passed off most successfully. The Cardiff Chrysanthemum Society is to be congratulated on breaking away from the old-fashioned style and making their chief class eight vases of Japanese blooms instead of twenty-four distinct. The result quite justified the departure; for there were two long tables in the body of the hall entirely filled with big blooms in vases. The single vases with five blooms of one variety were most attractive classes. Another new class was for six pots Gloire de Lorraine Begonia. These were arranged down the centre of one of the long tables on a slightly higher stage, and the effect was charming. Mr. A. F. Hill, who carried off the N.C.S. certificate for the best bloom with a grand bloom of F. S. Vallis, is a most enthusiastic amateur, who personally grows his own plants to the smallest detail.

DAHLIAS.—Mr. W. Treseder's stand of Dahlias has become quite an annual feature, and I noted lovely coloured blooms of

the following: Etna, Artus, Ajax, Clarence Webb, Mrs. J. Crowe, Mrs. Carter Page, Mary (a new and attractive bicolor), Vesuvius, W. Treseder, Ringdove, P. W. Tulloch, Mr. Seagrave, Mabel Tulloch (a lovely pink), Eva (a good white), J. H. Jackson, H. J. Jones, Gabriel, Mrs. E. Mawley, and Mrs. Winstanley. He was awarded a gold medal.

At SWANSEA SHOW the chief honours for cut Chrysanthemum blooms were carried off by the Cardiff division, Mr. Hill again having the premier bloom, F. S. Vallis. This appears to be a grand variety and no one can overlook it. The writer had to miss Swansea this year, but was at

ABERYSTWTH SHOW, held the same day in the Pavilion on the Pier. The chief honours for cut blooms fell to Mr. Winstanley, gardener to Sir Pryse Pryse, Gogerddan, Aberystwith, who won the challenge cup for twelve Japs and twelve incurveds for the second year in succession. His best blooms were Lily Mountford (premier bloom), Mrs. Barkley, Kimberley, Nellie Bean, Mafeking Hero, W. R. Church, Mrs. G. Mileham, and Chenon de Léché amongst the Japs; and C. Curtis (grand), Madam E. Roger, Lady Isobel, Hanwell Glory, Edith Hughes, Ada Owen, and D. Foster. He had a bloom of Mrs. F. Judson 8in in diameter, but lacking depth and finish. Mr. H. Austin was second in this class, and Mr. Hazeldene, gardener to the Countess of Lisburne, was third. Mr. Winstanley also won in classes for twelve Japs and twelve incurveds with similar blooms. The groups of Chrysanthemums produced four competitors, led by Mr. Winstanley; second and third places being secured by Mr. J. Websdell and Mr. Jas. Purton respectively. Fruit was scarce, but vegetables were exceedingly well shown. Messrs. Clibran, Altrincham, and Messrs. E. Parsons and Co., Swansea, put up meritorious trade exhibits. Mr. Weller, the Corporation gardener, put up a very fine group of Chrysanthemums, not for competition.

What struck me as an excellent idea, and worth noting by other societies, was the combined programme and catalogue issued by the committee and on sale in the pavilion, all the exhibits being arranged numerically. It also prevented much confusion when staging. [Could you kindly send us a specimen?—Ed.] If enthusiasm counts for anything, Aberystwith Society should flourish for many years.—A. H.

### At Trinity Grove, Edinburgh.

Notwithstanding the unfavourable season, "Mums" are not after all to be such a bad turn-out in the North as we had expected; true, the bulk of the blooms are necessarily crown buds. Round the Hamilton district the show is by no means much behind previous ones, a fact which says a good deal for the general attention bestowed upon this useful winter flower. When recently at Trinity Grove, Edinburgh, I saw a fine collection of blooms likely to give a good account of themselves at the forthcoming show at Edinburgh. In our own lot damping of the petals is very persistent, and upon the whole they are not so satisfactory as usual.—D. C.

### W. Duckham and Cheltoni.

Growers in the United States of America appear, from the following, to be well satisfied with these varieties. We have waited long and expectantly (says a writer) for a pink Chrysanthemum that should be on an equality with the good white and yellow ones. The outcry has been, "Too much white and yellow; give us pink." And in the endeavour to supply the cut-flower market with pink the fickle and uncertain Vivian Morel has been the grower's mainstay, but with more vexation than profit. We need no longer deplore the paucity of pink, for, as an early pink variety, Mrs. Coombes improves with age and is here to stay, and succeeding it Mdle. Marie Liger has strengthened the good impression it created last year. In William Duckham, however, we have the advent of a peerless beauty of surpassing merit, vigorous in growth, stout in stem, well clothed with heavy foliage, and crowned with a flower that may be termed perfection alike in form, finish and colour. Our English contemporaries gave it great praise when it won the silver medal at Edinburgh last year, but some of their greatest acquisitions have refused to adapt themselves to American conditions. Here we have one that asserts itself at once, attains the zenith of Chrysanthemum beauty in its first season, and apparently deserves the highest meed of unqualified praise. Chrysanthemum W. Duckham was raised in England from Australian seed, and probably herein lies the secret of its ready adaptability, since the Australian varieties have already shown a facility of response more marked than those entirely of European origin. The short neck is no detriment; in fact, rather enhances the beauty of the flower by giving it a slight elevation above its mantle of luxurious foliage, so that the eye can better appreciate its bold yet graceful contour. The colour is a clear uniform light pink. Cheltoni is a sport from Nellie Pockett. It is in every respect a counterpart of its parent, in a really good shade of yellow, altogether brighter than is usually seen in a yellow sport from a white variety. There appears to be a slight variation in form, the petals more closely unfolding.

**Epigæa repens (Mayflower, Ground Laurel, or Trailing Arbutus).**

On the mountains of Pennsylvania this hardy evergreen shrub seems to grow in luxuriance. Its beautiful white flowers tinged with red exhale a rich spicy fragrance, and blooming in May as it does it breaks the monotony before summer has scarcely proved her presence with us. This species thrives best in peat soil and in shady situations, and many northern aspects would be quite suitable for its existence. Some healthy patches of it are to be seen in the Wisley Garden.

**Berried Solanums.**

*Solanum capsicastrum* (Jerusalem Cherry) and Celestial Peppers ought to be well berried by this time. The fruit hangs on for a long time and is now assuming its many-coloured hues. Give the plants plenty of room to keep the lower leaves from falling, and if they appear to be in the least pot-bound feed with liquid manure once a week. This will give the foliage a dark green colour. They should be well syringed daily, for the scale is liable to infest them, and is difficult to dislodge when it once gets a foothold. A temperature of 55deg at night and the full light at all times is an essential.

**Forcing Spanish Irises.**

The following was given in answer to a correspondent of the "American Florist":—We have never been able to force Spanish Irises successfully. For the past few winters we have tried to force a few hundred bulbs, experimenting in different ways, but our efforts have been in vain—the bulbs, with the exception of a few, simply do not flower. One batch we handled just as we do Dutch bulbs—that is, we planted them in boxes and allowed them to remain outside in a frame until February, and then subjected them to a temperature of 50deg; another batch we kept indoors in a cool house of 45deg all through the winter; a third batch we placed in a temperature of 60deg after the bulbs were nicely started; in all three cases, however, the bulbs failed to flower in sufficient quantity, and we have finally come to the conclusion that they cannot be forced successfully. If any florist has had success in forcing them, we should all be pleased to hear of his method.

**Cobæa variegata.**

This is a form of *C. scandens* which is considered one of the finest of climbers, especially good for indoor work and conservatories, though it does well outside if started in midwinter, and plants well provided with roots are used at planting time in spring. All the fine qualities as a clean, rapid climber found in the old, well known *Cobæa scandens* unite in this splendid new variety with the additional charm of its unique colour-variegation of foliage and flower. The dark green leaves are bordered by a band of deep golden yellow, becoming almost pure white on the matured foliage. If exposed to the sun this variegation is blended and interlaced with delicate red and violet shades, all this exquisite colouration extending from base to top, enhancing greatly the beauty of the flowers. It is also claimed that this new kind in all its parts is more robust and vigorous than the old sort, yet in its growth and habit more refined and graceful. It would seem that a plant with these attributes would soon be found in every garden and conservatory on the globe, but it is feared such will not be the case, as it may be many years before plants of *Cobæa variegata* can be obtained at anything like a reasonable price. It was introduced by J. Veitch and Sons, Chelsea, but as yet is not listed in catalogues of many growers, though found on a few private places. Its scarcity is owing to the fact that this novelty is one of the most difficult to propagate. From seeds, as is the case with all variegated plants, propagation resulted in disappointment to the experimenters; root-grafting was a total failure, and nearly all the cuttings, taken in the usual way, rotted. Still the latter method is the only one resorted to, short stocky shoots furnishing the largest percentage of callus-forming cuttings. About five out of 100 will root.

**Nicotiana Sanderiana.**

This novelty ranks as one of the most promising for general use, and which is sure eventually to find its way into every park and garden. It is a cross between *Nicotiana affinis* and an unnamed plant of the same genus. The flowers are of the brightest carmine red, are large and numerous, and last fully two weeks. One of the plants shown had twenty-two flower stalks with 234 open flowers. The time of flowering is about three months.

**Floral Decorations.**

Among the designs seen in leading London West End shops recently were the following: A cushion of white Chrysanthemums, fringed with Lily of the Valley (one spray in a single leaf each), and a loose bouquet of pink Carnations was poised on the left-hand upper corner. Another design was that of a cross furnished with grey lichen, with Poinsettia bracts arranged with white flowers at the crosspiece.

At Belfast show Messrs. A. Dickson and Sons had a miniature lake bordered by choice Ferns and dwarf plants, on which a floral full-sized swan was gracefully floating. Another beautiful design was a mirror, exquisitely framed with deep yellow Chrysanthemums, cornered with knot-trophies of Orchids. Placed on an easel, draped in soft tulle, with two white birds on top, it was most effective.

**Fuchsia microphylla.**

It is with great pleasure that we hail this old, almost forgotten favourite. E. J. Peters says: "Growers of to-day have no time, no room to spare in their over-stocked greenhouses, to give a fair and thorough trial to new introductions; one novelty has to make room for another, and that is thrown out to afford room for the next. How, then, can it be expected that gems of the past like this one and many others, far superior to ninety per cent. of present day novelties, will find recognition? Their place in our greenhouses is occupied by new plants, and yet was there ever a pot plant so thrifty, so floriferous, so beautiful in its mantle of hundreds of purplish red blossoms, its finely cut foliage, and so easy to propagate and to grow as *Fuchsia microphylla*?"

**Antirrhinums to Succeed Chrysanthemums.**

According to "American Gardening," one of the most useful flowers to follow the Chrysanthemum is the Antirrhinum. If the benches are cleared of all stock, plants given a coating of rotten manure or fertiliser, and spaded over, the Antirrhinums transferred from pots will quickly take hold. If no pot plants are at hand, late sown or rooted plants from the open ground will do very well. Do not attempt to grow a promiscuous assortment of colours, but stick to one or two good colours, like white, yellow and pink, propagating from the best strain each season. Antirrhinums can be supported in the same way as Carnations, allowing the cross pieces of twine about three inches more width. This will be found better than tying the plants to stakes, which necessitates cutting the ties each time a spike is needed. Nice plants may also be grown in 5in or 6in pots.

**Interchange of Plants.**

There is one sort of trade, if it may be so called, within the British Empire which has not waited for fiscal or any other artificial inducements to become firmly established. It is related in the official report on the administration of Seychelles last year that the curator of the Botanic Station had "personally conducted" himself to Java, Ceylon, and other lands in the tropical belt, to ascertain what plants there growing could be hopefully experimented with in his own little colony. This process is going on in most parts of the Empire; there is constant exchange between them of plants and animals. Of course, many of these emigrants refuse to become acclimatised in their new homes, but in numerous instances, brilliant success attends the endeavour. Australia, for example, is indebted to the process for her finest fruit and salmon, both being derived from importations, while English horses, cattle, and sheep have founded illustrious families in all the leading colonies possessing congenial climates. On the other hand, the gracious bird which figures so largely in the British menu at Christmas came originally, like the proud peacock, from the East. It seems, moreover, that English hothouse Pines and Grapes beat their foreign ancestors' hollow for quality; and in the Scilly Isles, some of the Narcissus growers are said to be hopeful of acclimating the Banana at Treviso.—("Globe.")

## Hardy Coniferous Trees.

### Conifers for Window Boxes.

This is the time when every effort should be made to encourage a more extensive use of Conifers in exterior window boxes and vases. Get as much of this work done now as you possibly can. It is next to madness, nay, even barbarous, to have this work delayed until the soil is frozen, when shrubs are dug up with pickaxes, roots broken and the soil shaken away, and the work otherwise carelessly done, with the inevitable result that the work must be done over and you possibly lose a customer. Ivy seems to have done remarkably well this year. You need not disturb those growing in the vases or boxes, and when you order your Conifers, insist that the roots be kept moist.

### *Picea pungens*—Koster's Blue.

*Picea pungens*, or *Abies pungens*, as some nurserymen list it, is one of the most valuable of our native ornamental evergreens (says Mr. J. Meehan, of New York State). In the first place, it is one that is hardy over the whole of our country, practically, being a native of the mountains of Colorado. As it exists in its native home, great variations are found in the colour of the foliage. There are some of the typical green as displayed by most evergreens, and from this there are forms running to those of a most lovely silvery blue. It has been the aim of all growers to select for propagation the kinds of deepest blue colour, and it is because of this that it has become known everywhere as the Colorado Blue Spruce. Collectors aim to select seeds from the bluest trees, which reproduce their kind fairly well. Many nurserymen here and abroad have selected a particularly blue one, and have propagated from this particular tree. Koster has done so, and because of this the beautiful silvery blue foliage of his stock has made Koster's Blue a well-known type of the best. In June, when the young growth is in perfection, the beauty of these trees is very great. [We might add that in England it is one of the most ornamental Conifers here grown.—Ed.]

### The Planting Size of Evergreens.

In conversation with a fellow nurseryman recently (observes Mr. Meehan in an American contemporary), on my remarking that there was a dearth of large evergreens, he said he was very glad there was, and he then went on to relate how the large evergreen and the large deciduous tree were each a menace to the good feeling which should prevail between the nurseryman and his customer. These large trees were hard to dig successfully, hard to deliver and hard to grow, he said; and for all concerned the smaller-sized tree was much the better. There is a great deal of truth in what this friend stated. When advice is asked me I invariably urge the selection of a medium-sized tree. It is surer to grow, and will overtake a larger one in almost all cases, as its roots are not injured in transplanting to the extent those of larger ones are. And then there is the satisfaction of seeing the smaller one gain stature and thrive! An evergreen of three feet and a deciduous tree of eight feet make an appearance at once, and in a very short time double their height. The nurseryman is safe, and so is the customer, when such trees as these are planted. In the case of a dwelling with no trees about it, it is proper to set large trees, to be in character with their surroundings, even if they do stand still for a year or two; but, as a fact, smaller trees will usually outstrip them in growth.

### The Beautiful Nordmann Fir.

The unwonted sight of some Nordmann Firs being used for Christmas trees in the way of decorative plants in tubs, leads me to say a few words in favour of this lovely evergreen. The fact of its being used denoted progress in the way of spending money at least, for a Nordmann Fir costs cash, and the plants seen, being not less than three feet in height, were such as sell at 12s. 6d. to 20s. 6d. each. Having a broad spread and such handsome green foliage, it could not be bettered by any other kind for certain positions, such as a centrepiece for a table, where a green tree is wanted, not for the hanging of presents. Such trees as this are for the wealthy; the mass of the people will be satisfied with a Balsam Fir, Norway or White Spruce. The Nordmann Fir is really the king of Firs in the northern States of America. It is always of luxuriant appearance, even though it has just passed through a hard winter; and this can be said of but few other evergreens in the family of Firs. In the matter of transplanting (says Mr. Meehan), it is not a difficult case. With a little care, seeing to it that the roots do not become dry, transplanting is usually successful. One cause for the reason of this beautiful evergreen being higher-priced than some others is its exceedingly slow growth for the early years of its seedling life. For a year or two the little plants are barely out of the ground. Every year thereafter their advancement is less slow until, when of a three-foot size, six to ten inches a year will be added to their height.

## NOTES

### Chrysanthemum Show Dates.

York show will be held on November 16, 17, and 18, 1904, not November 11, 12, and 13, as credited by us to Mr. Molyneux on page 463. Hull show will be held on November 16 and 17, 1904.

### Edinburgh Chrysanthemum Show.

There were over 800 entries. The number of cut Chrysanthemum blooms in competing stands was 2,224, besides those in groups and non-competitive exhibits. In plant competing classes there were 220 Chrysanthemum plants. The money taken at turnstiles during three days was £1,069, being £110 ahead of last year's drawings. Over 40,000 persons visited the show.

### Irish Gardeners.

The first conversazione of the Irish Gardeners' Society was held recently in the XL Café, Grafton Street, Dublin. The chair was taken by Mr. F. W. Burbidge, M.A., and a choice musical programme was given. Mr. F. W. Moore, of Glasnevin Botanic Garden, discoursed on the wealth of colouration in foliage, and referred to the glories of the autumn garden and the rich diversity of colour. Mr. F. W. Gunn had an instructive array of microscopes and botanical slides. He displayed the rotation of the protoplasm in *Valisneria spiralis*.

### Dr. Masters on the Classification of Conifers.

We are informed that Dr. Maxwell T. Masters, F.R.S., lectured before the Fellows of the Linnean Society at their meeting on Thursday, November 20. The Doctor, who has had an accident to his arm and carried it in a sling, proposes to place Conifers into two great groups: one with thick foliage leaves and thick scale leaves in the cones (the flowers), the other represented by those with thin foliage leaves and scale leaves. Dr. Masters has specialised in Coniferæ for many years, and is a noted authority on the Order.

### Birmingham University and Plant Diseases.

The lecturer on Botany of the University of Birmingham, Mr. A. H. Reginald Buller, D.Sc., Ph.D., has instituted a course of lectures on plant diseases, which it is hoped may result in the foundation of a new sub-department of vegetable pathology. The department would concern itself with the economic aspect of disease in cultivated plants and timber. The present course of lectures will have an important bearing on the newest methods of treatment of plants by spraying with chemical solutions, which has been shown by official returns to give an increase in the weight of crops amounting to about 30 per cent. The importance of vegetable pathology may be gauged from the fact that the great Potato famine which is reputed to have reduced the population of Ireland by about two millions was brought about by the ravages of Potato mildew. The lecturer has been engaged in research work for four years in Germany into the subject of plant and timber diseases.

### Lecture on Heating and Ventilating.

On Friday last Mr. W. J. Simpson (late of Falkland Park Gardens, Norwood) gave a lecture before the Beckenham gardeners on "Heating and Ventilating Horticultural Structures." The lecturer favours the upright tubular boilers, and would recommend two medium boilers rather than one larger one. Pipes should be distributed over the houses to better equalise the temperature. Rubber rings for joints were favoured, also Portland cement. Of course, simultaneous ventilators with lever arrangements were recommended, but how many of us have yet to drag away at the clumsy top sliding light and casement front sash! Mr. E. R. Palmer, sanitary and hot-water engineer, Beckenham, who presided, gave some very practical remarks as to dealing with damp stokeholes, &c. He also claimed that first-rate results may be obtained from the plain saddle boiler, well set. Mr. Robertson, of Winterdync, secured a certificate of merit for a vase of Japanese Chrysanthemums.—T. C.

**A Correction.**

An error crept into the heading of my notes on "The Priory," published last week, page 468. The heading should have read "The Priory, Warwick," instead of Leamington as published. —WANDERER.

**Birmingham Gardeners.**

The annual discussion on the leading features of the Birmingham Chrysanthemum, fruit, and vegetable show took place on November 16, and, as usual, was opened by Mr. W. Spinks, the treasurer. A Cultural Certificate of Merit was unanimously awarded to Mr. H. Dedicott, gardener to W. A. Wiggin, Esq., Griffin's Hill, Selly Oak.

**Permanent Canadian Exhibition.**

We are informed that the Dominion officials in London have taken a very wise step in giving their patronage and support to the permanent Canadian exhibition now being arranged at the Crystal Palace. The Colonial Exhibits Company and the Crystal Palace Company are jointly erecting a handsome pavilion for exhibits of Canadian manufactures and farm produce, and Mr. C. F. Just, of the High Commissioner's staff, has been appointed honorary organising secretary to the show. It is said that special attention will be given to articles entered for household consumption and domestic economy in this country, and all articles in which Canadians hold their own with the United States, while periodical displays from Klondyke and other special districts will also be held. No better way of influencing business or emigration could be imagined, for an enormous crowd of 'desirables' visit the Palace yearly, and, as the place is not overstocked with exhibits, an attractive stand is sure to command attention."

**National Chrysanthemum Society—The Floral Committee.**

A largely attended meeting was held on Monday, November 23, at the Essex Hall, Strand. The exhibits were numerous, but the majority were much below par, and received scant courtesy at the hands of the committee. If exhibitors would only recognise the fact that unless their seedlings or sports are in the best possible condition they will never obtain an award, the committee would not be troubled with half the varieties they inspect at the present time. On this occasion only three varieties obtained recognition. Lady Cranston (W. J. Godfrey). It is a sport from Mrs. Barkley, pure white, with the Barkley colour clearly shown at the top of the flower; a most effective variety, probably the best seen this season; F.C.C.—Dorothy Pywell (W. Seward). A fine creamy white variety, which is already in commerce. The magnificent blooms staged fully justified the award of F.C.C.—Pink Pet (J. Peed and Son). A single, rosy-pink, very free flowering; distinct and good; F.C.C.

**A Notable Australian Horticulturist.**

Mr. C. Bogue Luffmann, principal of the South Australian School of Horticulture, though of singularly youthful appearance, was born in England something over forty years ago. At a very early age he went to sea, and saw a great many outlandish places and peoples. Of necessity and by inclination he has followed many different callings; but whatever his employment, he has always found time to make a close study of agricultural and horticultural subjects, and has had the advantages of travel, study, and experience in all the most important centres of Europe. He has written books of travel, stories of adventure, and a great deal of matter of a curious and educational character. Mr. Luffmann has also had the honour of supplying special reports on various rural industries of Continental Europe to the British Government. He takes no interest in exhibition flowers, but is a devoted lover of gardening, and his great and only ambition is to plan the agricultural and sylvan features of the Federal Capital, if it is established in his day and generation. With the object of creating a standard of taste in Australian gardening, he is at present engaged in giving a course of lectures on garden design and management. These lectures will shortly be published. Mr. Luffmann (says the "Garden Gazette," Melbourne) is generally regarded as one of the finest platform speakers in the service of the Government, a fact which told in his favour when he had the misfortune to be misunderstood by some of his fellow horticulturists.

**Jones' Chrysanthemum Guide.**

Mr. H. J. Jones, of Ryecroft, Lewisham, sends us the new issue (13th ed. 1903) of his Chrysanthemum Guide. It is a book of over 62 pages of text, and deals with all phases of the culture of this interesting and beautiful flower. In paper covers it costs 7d. post free; or 1s. 2d. if the cloth boards type is selected.

**Appointments.**

Mr. H. Sweet, late head gardener to W. P. Snell, Esq., Belmont Park, Bedhampton, Havant (Hants), in the same capacity to Miss Meiklam, The Towers, Bedhampton. \* \* Mr. J. Turton, for the past seven years gardener at Becca Hall, Leeds, has been appointed gardener to Mr. and the Honourable Mrs. Foster, Stockeld Park, Wetherby, Yorks, and enters upon his duties early in December. \* \* Mr. Edward Rutherford, late gardener to E. M. Courtanev, Esq., M.P., Dunmore, Glenagary, co. Dublin, has been appointed gardener to Lady Keane, Cappoquin House, co. Waterford, and entered on his duties November 11.

**Cardiff Gardeners' Association.**

On Tuesday, November 17, the members met at the Central Free Library to view the large and costly collection of books on horticulture, this being the fifth successive year that a meeting has been arranged. The librarian is fully convinced that in this way the books are more readily sought after than had been the case before. Many volumes (ancient and modern) have been added since the last visit, for Mr. Ballinger is at all times on the alert for anything that he considers worth adding to this department. An enjoyable evening was spent, and the best thanks of the members were accorded the librarian.

**Women and Horticulture.**

Mr. A. D. Hall, director of the experimental station at Rothamsted, recently delivered an address on "Horticultural Instruction for Women." Horticulture had of late experienced an enormous expansion in England, and there was no reason to suppose that the expansion was over yet. The expenditure on private gardens and the demand of the public for fine fruits and flowers were growing year by year, and in such a developing industry women were far more likely to find their opportunity than in an occupation which had settled into routine. A demand for teachers of horticulture existed, and could be met by women. Country elementary schools were being pressed to take up some form of instruction bearing on rural life. Hitherto the great difficulty had been the lack of trained teachers, but now that the county councils had taken charge of elementary education he hoped to see specialist teachers appointed to groups of schools. Properly educated women would be the best possible teachers for such work. On the motion of Sir John Hibbert, a resolution was carried pressing upon the Government the claim which colleges for the horticultural instruction of women had to some share in the fund placed at the disposal of the Board of Agriculture for educational purposes.

**Glasgow's New Park at Thornliebank.**

What Lord Provost Sir John Ure Primrose, Bart., has described as the brightest gem of Glasgow's group of public parks, is that part of the Thornliebank estate, generously gifted to the city the other day by Mr. A. Cameron Corbett, M.P. A charming feature of the estate is the romantic and picturesque Rouken Glen, in which the visitor might imagine himself a hundred miles from the din and bustle of a great city. The Rouken stream and waterfall add greatly to the beauty of the park, which is certain to become one of the most valued of Glasgow's numerous outdoor possessions. The part which has been purchased by Mr. Cameron Corbett, and offered to Glasgow as a public park, covers 136 acres or thereby, and has cost £24,000. Along with this the donor has generously handed over the mansion house of Thornliebank, costing £30,000. A further portion of the estate, covering 190 acres, has been acquired by the trustees of Hutchesons' Hospital for feuing, at a cost of £22,000. The new park equals in extent the oldest of the city's pleasure grounds—Glasgow Green—with which it will rank as second in respect to Bellahouston Park, which covers 185½ acres. With the addition of Thornliebank, the park acreage of Glasgow will amount to the extensive figure of 1,195½ acres.

### Rose, Niphetos.

We cannot do better than quote the author of "The Book of the Rose" in part of what he says of Niphetos:—"This Rose is a good instance of what is termed 'free' growth, i.e., neither long nor stout, but branching, and generally growing somewhere. The foliage is good and not much liable to mildew, but the blooms will not stand rain. . . . Niphetos, the purest of all white Roses, has a long bud, especially suitable for bouquets and wreaths. It is also free-flowering and bears forcing well. It is no wonder, therefore, that it is, and has been, cultivated for market purposes to an astonishing extent. It is also capable of being exhibited as a Rose of great merit, with very fine petals and of the largest size; but in this respect it seems to have deteriorated or been superseded, as it is certainly not so often shown now as formerly. They must be cut young for show, as the shape is not lasting. . . . It is free-blooming throughout the season, but the autumnal buds do not come large, and require fine weather. It does not do as a dwarf, for the blooms come smaller, and the wood being neither stiff nor upright, the petals get much injured by wind and rain. . . . It is best for exhibition as a maiden standard, and does well, if fully fed, on a low wall. The raiser was Mons. Bougère, and the name Niphetos means in English, 'snowy.'"

### Notes on Some of the Newer Roses.

(Concluded from page 465.)

Coming next to the new Teas named in the recent Rose analysis, there can be no doubt that the three candidates selected have come out in the election in their proper order of merit. Mrs. E. Mawley rightly heads the list: issued in 1899, this fine Rose, whose only approach to a fault is a weakness in very hot weather, is no doubt by this time sufficiently well known to all exhibitors.

Souvenir de Pierre Notting, on the other hand, having only been sent out last year, is hardly well enough known yet, though I fancy it might have been had from the raisers, Souper et Notting, in 1901.

Being a cross between Maman Cochet and Maréchal Niel, it undoubtedly should have a goodly heritage, and great things might well be expected of it. Very good accounts have reached me of its growth and the beauty of the flowers, and I cannot doubt their accuracy. But it has failed to make any strong growth with me at present, either as dwarf or standard, and I have been rather disappointed with the colour, except under glass. I hope for better things next year, and in the meantime all lovers of Tea Roses should certainly make a point of getting it.

Lady Roberts, the last on the list, is a beautifully coloured sport of Anna Olivier, which it seems to be identical with in all but colour. As the well-known original is itself very variable in colour, flowers on the same plant coming occasionally nearly as clear in tint as Madame Hoste, and at others with more or less prevalence on the pale yellow ground of buff or terra-cotta, occasionally nearly tinting the whole flower, it is odd that Frank Cant and Co. should have succeeded in fixing this sport, as I take it they have done, and they are to be congratulated on the achievement. I have not personally tested the variety sufficiently to be able to say anything as to any particular manners and customs it may have.

I should like to mention two other new Teas which I have tested. Boadiea (W. Paul and Son, 1901) I have only had as maiden standards, a position in which Teas are often not seen at their best. It seemed to me, however, to be very promising as an exhibition Tea, large enough, with good point, stiff lasting petals, and attractive and distinct colour.

And those who are anxious to have a variety which will give flowers of a really good yellow, a deep colour, shining like a lamp among hundreds of other plants, might try Georges Schwartz (Schwartz, 1899), for I think the colour, which fades but little in the sun, is the best yellow among the Tea Roses.

Unfortunately, I am afraid it has not very much to recommend it besides the colour, though the shape is pointed and good: it has not proved a strong grower with me, or free in flowering, and a single-stemmed maiden shoot will barely produce a bloom large enough for show. Beyond the sole point of colour, it is plainly not a variety to recommend for general cultivation.

Of new "breaks" among garden Roses, the most noteworthy seem to be Soleil d'Or (Pernet Ducher, 1900), a hybrid Austrian Briar, the first novelty in that section for more than sixty years,

and rugosa repens alba (Paul and Son, 1903), a cross between the rugosa and Wichuraiana families, which appears to be an astonishing Rose to grow and flower.—W. R. RAILLEM.

H. T., LIBERTY.

Liberty Rose requires from eight to ten degrees more heat than is usually given to Bride and Bridesmaid. Above all never let it receive any check that will encourage its propensity to go to sleep in cold weather. When it once is allowed to get drowsy, that settles it.

## Hartham Park, Corsham, Wiltshire.

MANY interesting features are to be found in the gardens and grounds attached to Hartham, the well-known residence of Sir John Dickson-Poynder, and it needs only a brief space of time for others to develop, since so much that is new is constantly being taken up in the several phases of garden work. Some striking examples of the rare judgment of "Capability Brown" are to be seen in the early history of the gardens, the effects of which are now so fine and bold in character. Brown possessed an originality of mind that few can imitate, but Sir John Dickson-Poynder and his gardener, Mr. Welch, by joint conceptions, are laying the foundation of new features which, if they do not eclipse old styles of landscape work, may at any rate add new features to those already existing, commensurate with the demands and requirements of the present day taste.

To relate all and everything already accomplished and still in progress would require much space to do justice to the theme. It might be said, however, that the lawns have been considerably extended. Choice specimens and clumps of rare flowering and ornamental shrubs have been planted, together with pergolas of Roses and other familiar trailing plants. The creation of broad terraces with sheltering belts of Yew, has been taken up with great success, though not without considerable labour—for an under stratum of rock makes the work both heavy and slow. On either side of the terrace are broad borders filled with herbaceous plants in large variety, and of considerable extent, and, when complete, will change the whole aspect of the place and brighten the heavily timbered and undulating landscape, so much of which comes within the range of the mansion and grounds.

New ranges of glass have been erected, and others are in contemplation, which are indeed necessary to cope with the heavy demand made on the garden. Large lean-to structures have for many years supplied the yearly crop of Grapes; these are now augmented by young Vines planted in a new span-roofed house. It has seldom been our privilege to witness such a wonderful Vine growth or such promising results in crop. The borders are constructed on piecemeal principles, the existing provision being but four feet wide, and having a depth of three feet. The main rod of this year has a length of 10ft, fully furnished with lateral growths, and though planted so recently as May, 1902, there is a girth of 3½ in in one or two of the shortest rods. Added to the turf procured locally is burnt refuse and a small admixture of half-inch bones, yet so simple a border gives astonishing results in leaf and fruit growth. From the eighteen Vines, over one hundredweight of Grapes have been cut this year, and there is every indication of a heavy and full crop next season, the ripeness of the growth tending towards a mahogany-like solidity, which is much prized by all Grape growers.

Another speciality of Hartham is the cordon Pear wall, of which Mr. Welch is justly proud. The crop here, as in most gardens, was much below the average, though some fine fruits were gathered. Some beautiful clear-skinned fruits of Doyenné du Comice, Beurré Hardy, Beurré A. Lucas, Marie Louise, Nouvelle Fulvie, Beurré Bachelier, Bergamot Esperen, Pit-maston Duchess, Beurré Superfin, Beurré Diel, and Emile d'Heyst were stored, many of them being over one pound each.

Cyclamens are well grown in about a dozen varieties to the number of 200—and such plants! Really, one is made envious in the privileged inspection of such a magnificent collection of plants and colours. Sutton's Giant White, Salmon Queen, Vulcan, Papilio (Butterfly), and others, make the air quite odorous with their pleasant perfume.

Calanthes, some 150 in number, are not less useful for the furnish of the stoves and the decoration of the dinner table. These are not grown in pots larger than 6 in, and some are less than this. Though C. Veitchi are the most numerous, C. vestita and C. v. rubra and C. bella are present in sufficient numbers to make a varied show, and the bulbs unusually strong. On shelves in the same houses Adiantum Farleyense, in 54-pots, simply reveal in the sun and moisture-laden atmosphere of summer time, as also do large baskets of Asparagus Sprengeri, so useful for cutting. Crotons (Codiaeums) and Dracenas fill a compartment, both being conspicuously bright and well grown.

A house full of Zonal Pelargoniums was most striking in

colour and flower trusses, which are immense, the varieties being Paul Crampnell and Athlete. With a good batch of these in winter time, Mr. Welch considers Poinsettias unnecessary, because their trusses and the colour are equal, if not superior, and their season of use a much more extended one.

The familiar and pretty pink Begonias Gloire de Lorraine were very much in evidence, and nowhere have we seen finer coloured or more vigorous specimens in their various sizes.

Another item of importance are the Chrysanthemums, which are this year so fine in flower yet dwarf in growth. Among the groups of large specimen flowers we observed distinguished blooms of Edward VII., Mr. L. Remy, C. H. Curtis, Nellie Pockett, Madame G. Debric, M. A. Barrett, Mrs. G. Mileham, Mrs. Mease, Madame Carnot, Queen Alexandra, Miss A. Biron, Jane Molyneux, Mafeking Hero, and Mermaid. These are only a few of the more striking flowers on view, but the season over which a supply is needed demands not only a goodly number of these specimen flowers, but a quantity of bush plants, both for cutting and as plants in the house. For this a large selection is made, including singles, which are so well adapted for the lighter phases of floral work. Hartham Gardens are so full of interesting studies that one might continue almost indefinitely to recount their variety and purpose; but sufficient has been already said to show what credit redounds on the head gardener and his co-workers.—W. S.

## County Council Instruction: Horticulture.

In preparing the new issue of the "Horticultural Directory," its editor has included a full list of instructors in horticulture, as appointed by the respective County Councils in England, Wales, Scotland, and Ireland. The responses to his communications contained some interesting information which could not be published in the "Directory," but which the editor has kindly placed in our hands. The following are extracts from the letters received:—

BUCKINGHAMSHIRE.—The instructor is Mr. Phillip Mann, but there is no experimental garden.

CAMBRIDGESHIRE.—Mr. E. Hobday is the instructor, and there is an experimental garden and county school.

CHESHIRE.—In connection with our agricultural and horticultural school at Holmes Chapel, we have large gardens, &c., and every provision for giving instruction in horticulture. See accompanying report, pages 70-76. [This, and other reports, we hope to deal with again.—ED.] Lectures are given in horticulture as per report.—RD. P. WARD.

CORNWALL.—Our instructor in horticulture is Mr. C. Hott, Lemon Street, Truro. We have several experimental gardens.—JOHN GILL, Kelston.

CUMBERLAND.—The name of the instructor in horticulture appointed by this County Council is Mr. George P. Berry (on the staff of the Durham College of Science, Newcastle-on-Tyne). An experimental fruit garden is maintained at the County Farm School at Newton Rigg, near Penrith.—C. COURTENAY HODGSON, M.A., The Courts, Carlisle.

DEVONSHIRE.—There is no experimental garden, but fifteen centres have gardens for teaching purposes. Our students number about 300, with fifteen local instructors. An assistant instructor is employed during each winter, but a second permanent one will probably soon be appointed.—C. BERRY.

DURHAM.—The County Council for this county has not specially appointed an officer to give instruction in horticulture. Northumberland, Durham, Westmoreland, and Cumberland are in co-operation in connection with the Agricultural Department of the Durham College of Science at Newcastle. All lecturers required are provided by that College.—J. A. L. ROBSON.

GLOUCESTERSHIRE.—Mr. W. Iggulden, Frome, Somerset, is our instructor in horticulture. We have no experimental garden.—HENRY A. HOWMAN.

HERTFORDSHIRE.—The County Council's horticultural lecturer is Mr. A. E. Burgess, 9, Glenferrie Road, St. Albans. We have no experimental garden (as such), but boys in evening schools have garden plots, and are instructed in gardening by Mr. Burgess.—A. DEAN.

ESSEX.—The lecturer in the principles of horticulture is Mr. E. Chas. Horrell, F.L.S.; in operations of horticulture, Mr. Chas. Wakely; assistant lecturer and demonstrator, F. J. Chittenden; gardeners, Mr. C. W. Aylett and Mr. A. W. Goldstone.—The school garden for instruction and experimental work in horticulture is three and a quarter acres in extent, and is at Chelmsford.

HEREFORDSHIRE.—The horticultural inspector in this county is Mr. A. J. Manning, 103, Green Street, Hereford. For some years we have had an experimental garden, but it will probably be discontinued next year (1904).—JNO. WILTSHIRE.

HUNTINGDON.—No instructor has yet been appointed. Arrangements for botany classes for teachers are in progress, and ground will be acquired for this purpose.—S. G. COOK.

LEICESTERSHIRE.—This county has not appointed an instructor, nor has it established an experimental garden, but lectures are given

by the staff of the Midland Agricultural and Dairy Institute.—A. J. BAKER.

COUNTY OF THE PARTS OF LINDSEY, LINCOLNSHIRE.—Our education committee have not appointed an instructor in horticulture, and we have no experimental gardens.—CHARLES SCORER, Lincoln.

LONDON COUNTY COUNCIL.—The Technical Education Board of the London County Council is not giving any direct instruction in horticulture, but (1) Is making grants in aid of the Horticultural School of the Royal Botanic Society in Regent's Park. Mr. J. Bryant Sowerby, at the Royal Botanic Gardens, can give full information respecting this school. (2) Has met the expenses of certain botanic gardens which have been laid out in some of the London parks by the Parks Committee of the Council, so as to illustrate the more common natural orders of plants. (3) Is assisting the Historic Records and Museums Committee of the Council, and the Council is carrying out certain instruction in Nature Study in connection with the Horniman Museum at Forest Hill and the gardens surrounding the same.—WM. GARNETT.

MONMOUTHSHIRE.—Mr. W. J. Grant, Pentonville, Newport, Mon., controls and directs the horticultural instruction given in this county. In addition to agricultural lectures, he gives lectures upon horticulture, inspects and advises both landlord and occupier as to pruning, planting, and renovation, &c. Mr. J. H. Wootton also assists, giving instruction as to packing fruit, and the vintage of both cider and perry. Mr. F. F. Herbert likewise assists, his speciality being the bottling of fruit, &c. Bee keeping also receives a good deal of attention from Mr. Wootton. A regular and systematic course of instruction in agriculture and horticulture has for some years been carried on at the Farm School, Little Mill, including the production of fruit trees for planting, the various stocks afterwards to be budded.

Rose, Niphetos.

and grafted by the boys. The work carried on in this school each year receives most favourable notice from the Home Office and in the Blue Book, while the demand for the trees is generally greater than the supply. At several of the elementary schools throughout the county, garden plots have, with most satisfactory results, been established.

NORTHAMPTONSHIRE.—The instructor in horticulture, employed in this county is Mr. J. H. Walker, 20, Moorgate Street, Leicester. We have no experimental garden.—BYRON R. SIMPSON.

KENT.—The horticultural superintendent is Mr. W. P. Wright. There is no public experimental garden for horticulture alone.

NORTHUMBERLAND.—The lecturer in horticulture in this county is Mr. George P. Berry, Cockle Park, Morpeth. I may state, however, that a grant for instruction in horticulture is made to the Durham College of Science, in return for which the services of the lecturer are divided between the counties of Cumberland and Northumberland. I am sending you a copy of the eleventh annual report on experiments with crops and stock at our demonstration farm. On pages 98 to 103 you will find particulars which may be of interest to you. There is an experimental garden in connection with the farm, and also fruit plots at two or three centres in the county under the supervision of Mr. Berry.—C. W. MANNS.

NOTTINGHAMSHIRE.—The instructor is Mr. J. Smith, 18, Clipstone Avenue, Peel Street, Nottingham, and our demonstration gardens (fruit) are at Arnold (1); and Hucknall-Torkard (1).

RUTLAND.—No instructor in horticulture has yet been appointed by the County Education Committee, nor have we as yet an experimental garden.—CLEMENT G. BONE.

SALOP, or SHROPSHIRE.—The instructor in horticulture for the Salop C.C. is Mr. G. Malthouse, of the Harper-Adams Agricultural College, Newport, Salop. Experimental work is done at the H.A. College, also at Wem Grammar School, and at Cleobury Mortimer College. All these experimental gardens are supported by the County Council.—W. H. PENDLEBURY, M.A.

### Apple, Annie Elizabeth.

I quite agree with "E. D." (page 442), that the merits of this fine late Apple are not sufficiently recognised. I have constantly recommended it during the last few years, because it is very handsome, crops splendidly, and keeps till April; and during March and April it is good either for dessert or cooking. If I were asked to name the three best late Apples I should say: Lane's Prince Albert, Newton Wonder, and Annie Elizabeth. —H. D.

### Large Cabbages.

The present year, with all its shortcomings (and truly they were not few), had some outstanding features in its favour. It has given, as records show in many places, crops of Potatoes in size above the usual, and occasionally approaching the stage of monstrosity. Big Cabbages also seem to be pretty general all over the country. Up the Clyde Valley a monster specimen was lately on view. In size it measured something like 9ft in diameter (sic), and weighed about 78lb. This ought to give satisfaction to enthusiasts in "big Cabbage" culture.—R. U.

### Indictment Against Horticultural Travellers.

Who among your numerous readers, occupying a head gardener's place, has not at various times been the recipient of a visit from some traveller in the seed line? "Mr. Nuisance" not unusually turns up at a most inopportune time, when perhaps the gardener is engaged with some of the gentry, or busy with some very important work. It matters not to persistent "Mr. Nuisance," who makes his inquiries (with an air of importance) from the first under gardener he encounters. On being told that the "Boss" is engaged with perhaps his employer, "Mr. N." promptly says he'll wait; and proceeds to swagger about the garden, often in full sight of gardener and his employer, and the latter generally inquires who the swaggerer is.

Perchance "the Boss" is engaged in some remote part of the garden. It is all the same to "Mr. N.," whose business is so pressing that one of the under gardeners wastes valuable time in seeking for his chief, who, on being found, is informed that "a gentleman wishes to see him." One traveller actually had the temerity to come right into the mansion for me.

Well do I recall the various dodges resorted to by one particular chief (while I was living under him as foreman), who would generally prime me with all sorts of messages and excuses to deliver to "Mr. Nuisance." On two different occasions do I remember the unwelcome callers at that particular garden hanging about the greater part of the day trying to catch "the Boss," but without avail, though the latter had various peeps at his uninvited visitors. I think I enjoyed the fun more than anybody. However, since I became a head gardener, I have had cause to understand my old chief's aversion to travellers.

"Mr. Nuisance's" greeting with gardener is, of course, most cordial, anxious inquiries after health (not only of latter, but of Mrs. Gardener and family). Next, as to the state of affairs relating to gardens, followed often by impertinent inquiries as to existing relations between gardener and employer. They will then proceed to relate an account of their past visits to other gardening establishments, laying bare the amount of business transacted. I am invariably told by "Mr. N." that So-and-So has just given him an order for so many pounds' worth of "stuff;" consequently one becomes acquainted with a considerable portion of our fellow craftsmen's business transactions; matters which, I venture to think, should be no concern of ours.

Then again, I find travellers generally give a place a good or bad name according to the value of orders they have been able to secure. For instance, one of those gentlemen alluded to a well-known gardening establishment as being no good. I was surprised, and gently intimated that as a great friend of mine was chief there I knew that the garden was well kept up, and the work well carried out. "Ah, yes!" said "Mr. Nuisance," "but they always object to paying more than they are obliged, and the orders we get there do our firm no good." I drew my own conclusions, as I know that in that particular garden money is not stinted.

So much has recently been written concerning gardeners and illegal commissions, that I will not enlarge upon this part of the many inducements which some travellers hold out to gardeners to do a little business with them. One case only will

I mention, which came to my knowledge a short time ago. A traveller offered a friend of mine 5s. cash down, there and then, as an inducement to give him an order for goods to the value of about £1. Needless to say, the order was not given, and I venture to think that that traveller will not show his face in that garden again in a hurry. The above is, perhaps, an exceptional case, and before concluding I should like to say that among the many travellers who have from time to time worried me, some have proved themselves to be excellent fellows. —A. N. NOYED.

[It is to be understood that the Editor takes no sides on any subject of debates, and each correspondent is alone responsible for what he states.—ED.]

### Wake Up! England.

Attention may be drawn to what our representative says of the Edinburgh Chrysanthemum Show, which is reported on page 498. We may add that the Journal's representative on this occasion was one of the best judges from the South of England. A Scottish correspondent also refers to the show thus: "The exhibition was a marvellous success, a wonderful contrast to your National [which he had the privilege to visit. —ED.] I think the Edinburgh show must soon become the National." Very handsome prizes are offered.

### Rose, Rosette de la Legion d'Honneur.

In answer to "H. H. B.," Mr. Mawley's Rose analysis consists solely of those varieties which have been shown at the Metropolitan Exhibitions of the N.R.S. during the last four years. The fact of the Rose above mentioned not appearing in the list of decorative Roses (p. 393) merely shows that it was not exhibited on those occasions. The variety, issued in 1896, was not held to be worthy of a place in the N.R.S. catalogue of 1902, and I confess that I do not know it, being quite unable to keep in touch with all the new decorative Roses. But good Roses do get omitted sometimes from the best catalogues, and "H. H. B." is a rosarian whose word should carry quite as much weight as mine.—W. R. RAILLEM.

### A Gardeners' Association.

On reading in last week's Journal about the proposed head gardeners' association, I concur in the formation of such, yet may I ask, What would be the qualifications required to become a member? Would it be exclusively for those at the very top of the ladder, or for all those, like myself, who are head of four? I entered the profession with the aim of one day rising to the top; but may I ask, How can I win upward? My own answer would be, that help could be derived by forming such an association, which might hold tests to show that a member is well up in the practice and theory of the craft, and the best men to be recommended for high places. The article under the heading of "Single-handed" in a recent Journal (page 395), seems to me to be exactly the state of gardening as it is. If only we, as a body, could raise the position of gardeners to the level we ought to have, by means of an association, I, for one, would go in heart and soul with it.—HAMPSHIRE.

### Sub-irrigation.

It would seem that sub-irrigation is hardly practised in this country, and I would like to hear of its successful application on either a large or small scale. From what I can gather, it was first heard of in 1890, when the Ohio Experimental Station published the results of its investigations in this direction.

The system consists in introducing water from under the soil. It must be remembered that "bench" cultivation is very largely practised in the United States; that is, a system of planting-out in benches filled with soil, in place of pot culture. The water, then, is introduced underneath, either by the use of porous tiles laid at intervals throughout the base of the bench, or by constructing the bench so as to form a shallow, water-tight tank, in the bottom of which are placed porous tiles. These are of various forms, the principle in every case being that they form a number of canals.

The first cost is considerable, and unless the watering is undertaken by a careful and experienced man great harm can be done. But provided the outlay can be made, and that proper thought is given to the mechanical operations, the final results appear to be all in favour of sub-irrigation. The soil does not become so hard or beaten down in consistency as is the case where the watering is down from above (generally from a hose). A more friable tilth is surely a gain.

A further good is obtained from the consistent, even warmth emitted from the cement and tiles at the bottom. These absorb the heat (which is sometimes too violent) and pass it gradually

upward through the soil. When the heat is turned off, or may have run low, these tiles remain warm, thus tending to the more regular and steady growth of the plants, as well as to the greater production of flowers. It has been said that the floral increase amounts to so much as 25 per cent in the case of Carnations, and that from three to four inches longer stems are produced, that can be got from plants not grown by the sub-irrigation system.—WATCHFUL.

### Travelling Grapes.

Referring to a show held recently, a correspondent observes: "Some of the Grapes I recognised as old friends, that have been travelling about since August, and they must have been a little gold mine for their respective exhibitors." A good many exhibits do this, but is this healthy "competition"?

### Scottish Horticultural Association.

(Queen Alexandra Chrysanthemum Prize, 1903.)

I have read with interest the notes of your correspondents "Interested," "Anglo-Scot," and "W. W. S." with regard to this prize, and, now that the show is past, one can judge in a fair impartial spirit the pros and cons of the case. I may say at the outset that when I first heard of our Council's proposal to give such a prize I was of the mind of your correspondent "Anglo-Scot" that it was "altogether absurd," and after going over the exhibits in the Waverley Market very carefully, my impression was only deepened, as I think the competition for the above-named prize only proved the needlessness of such a class being made. Those who took first places, I am sure, would have made a creditable show in the open class for twelve vases, and would have had a good "look in" in the classes for six and four respectively. I think the error the Council has made is that they seem to have overlooked the fact that their first object should be how they can best advance the science of horticulture, instead of which they have created a class for certain individuals. Now, no one doubts the ability of our gardeners in the City as growers of the Chrysanthemum, and if one requires proof of this we have only to recall to mind the splendid display of pot plants made in the market last week, which, for cultural skill, I am sure does the growers of such, every credit. Here is a class which should appeal specially to our City gardeners, as it cannot be expected that our friends in the country can bring such plants from a long distance. This is a class which I think might be encouraged.

Just a word to our friend "W. W. S." He says "they are nearly all town gardeners who attend the meetings," and that they deserve a class to themselves "for their trouble." I always thought it was accounted a privilege to attend the meeting; a privilege which, owing to circumstances, is denied our "country cousins."—W. D.

### The Golden Flower.

(See Illustrations on pages 492, 493.)

On the two next pages appear illustrations of Chrysanthemums from photographs taken by a *Journal* reader. The six Japanese blooms appear to have been very good, and it will also be conceded that the cottager's dozen flowers do him high credit. The illustrations of twelve incurved Japs are not so refined as could be wished. They were staged at a Southern show by Mr. G. Hall, gardener to the Dowager Lady Ashburton, of Melchet Court, Romsey, and the best, according to the photographer, were W. R. Church, Australie, Ethel Fitzroy, Mrs. Weeks, and General Buller. The set won for the grower (third time winner) a challenge cup; and a gold medal, instead of the cup, is awarded by the Society to commemorate this. The hint as to awarding a medal in place of a cup, might be taken by other societies that deplore the loss of valuable silver cups.

The stand of six (from which we name Bessie Godfrey, Matthew Smith, Lily Mountford, Madame Paolo Radaelli, and Mrs. Carrington) was shown by Mr. J. Lover, Park Road, Cowes, I.W., he being an amateur grower.

Lastly, the collection of twelve Japs from Mr. H. Moore, Frederick Street, Southampton—a cottager—contains A1 flowers of Mrs. Greenfield, Mrs. Coombes, Mrs. G. Mileham, Jane Molyneux, Alice Byron, and Pride of Madford.

## Transplanting Trees at Stancliffe.

The Stancliffe Estates Co., Ltd. nurserymen, of Darley Dale, Matlock, the illustration of whose method of lifting and replanting large trees is shown on this page, are the proprietors of the Darley Dale estates of the late Sir Joseph Whitworth, upon which, for the last seven years, they have been developing an extensive nursery business. The Stancliffe Hall gardens, comprising some forty acres, have been noted throughout the country for many years for the excellence of their extensive and choice variety of Rhododendrons, Coniferae, Hollies, &c., many of the specimen plants having been obtained at considerable cost. These gardens have formed an excellent nucleus for the Stancliffe Estates Co.'s (Ltd.) nursery operations, giving them exceptional advantages, many of the varieties thus available being extremely rare and difficult to obtain. Further, having such a large quantity from which to cut, the grafts and buds for propagating are strong and healthy.

Large areas have been broken up and planted with very choice varieties of Rhododendrons (named varieties, hybrids, and ponticums), "American" plants, evergreens, and deciduous ornamental trees and shrubs, in large variety, as well as forest trees, Roses, fruit trees, &c. The seed beds and propagating houses are very extensive, producing some millions of plants annually. The Company have also large vineries and fruit houses, producing quantities of Grapes, Peaches, and Nectarines.

The removal of large trees is a special feature of their business. They have successfully lifted and replanted some hundreds of such trees, some being as much as 35ft high, and some being taken a distance of ten miles.

Transplanting Trees.

## Trees of the Bible.

Most of the arboreal growths which flourished in Bible days are familiar to us in our own country at the present time, yet some we have little or no knowledge of, at any rate from personal experience. Thus among larger trees the Oak, the Poplar, and the Fir and the Cedar were then, as now, plentifully in evidence, while among smaller kinds the Box, the Almond, the Willow, and the Olive (though the latter not of course with us) may be instanced. Several kinds are, as will be illustrated in due course, wrongly translated, or at least representing a different tree to that understood nowadays.

It may be taken for granted that the most typical tree over Palestine generally, was the Olive, while probably the one most renowned in the northern portion was the Cedar of Lebanon. As to the former, it was one of the staple resources of the country, and afforded large results, either by its food and oil or the usefulness of its wood. It was synonymous with plenty and joy, hence "the oil of gladness." Abundance of oil was produced from the little black fruit, for which there was an extensive use among all classes, as among the Italians of to-day. Its wood, being tough and hard, was manufactured in various ways for buildings or making implements.

As we know from imported nicknacks in oriental depôts, it takes a very smooth and beautiful polish. Palestine was well fitted for its growth, as well on the richer portions as on the rugged hill slopes, and even now they render a tolerable account of themselves, though the rich, chalky surface loam has been largely washed away, leaving not much else but the bare rock.

They appear to live a great many hundred years, and it is not impossible some may be existent to-day that flourished in antiquity, especially those about the garden of Gethsemane, hard against the Mount of Olives. Many appear at the present time rather an eyesore or relic, like some of our own old Oaks, of a more prosperous day long past, so gnarled and twisted and lifeless do they appear.

The Cedars of the Lebanon, which grew in large numbers in this district, were specially used, for their durability and excellence, in the building of the Temple. They were the emblem of strength and majesty, and in this sense are employed figuratively more than once in the Psalms of David. Thus "they shall grow like a Cedar of Lebanon." Fine spreading monarchs of their kind they undoubtedly were, and well endowed to be as kings over their fellows, being without question the handsomest of all trees.

The Elm spoken of by Hosea was not this tree, but the Terebinth, or Teil tree, and it is thought by some that it was the Linden tree upon which Judas hung himself. It is scarcely known what is meant by the Bay. Not unreasonably it may be considered merely a general term and as an emblem of luxuriance; some, however, deem it to be the Oleander. Neither is it known what the gopher wood was, though perhaps the Pine. Other misnomers are the Hazel, which was presumably the Almond. This was common enough throughout Palestine, and it may be remembered that Aaron's rod which budded was of the Almond kind. The Myrtle, too, was a frequent growth in many parts, and seems to have attained a considerable height, though the Box, on the other hand, grew to no great dimensions.

We now come to the Sycamore, which is mentioned more than once, but the most familiar passage to us will be that of St. Luke which relates how Zacchæus, being small in stature, made use of one growing by the road-side to climb into on an important occasion, to see the better. But we must bear in mind here, again, it is not what we now call a Sycamore, but one of the Fig kind, though of a wild and unpalatable fruit. Thus it is recorded that the prophet Amos was a herdsman or gatherer of the Wild Fig, apparently for the swine or other cattle. It was found chiefly on the plains of the Jordan. Of Firs there were large numbers and of several varieties, the wood of which was used in building and for other multitudinous purposes. Also the Oak was represented by many species, perhaps the commonest being the Ilex or Evergreen Oak, which were very abundant in parts. The tree under which Abraham reposed on the plains of Mamre, in connection with the birth promised to Sarai, is supposed to have been

an Oak, the very tree being confidently pointed out to one at the present day at Hebron, though indeed it requires no pointing out, being a single magnificent specimen, carefully enclosed and evidently of hoary age, yet still flourishing in a remarkable manner.

The writer possesses at this moment an interesting souvenir of it in the shape of a very fine acorn, a fitting offspring of so illustrious a tree, being of a most unusual size, and picked up from under its wide spreading branches some few years ago, while on a visit to El Khalil, or Hebron. It was an Oak which caused Absalom's tragic end, and Deborah, the nurse of Rebecca, we read, was buried underneath one. —J. A. CARNEGIE-CHEALES.

## The Liliaceæ.\*

(Continued from page 435.)

The tribe Agapantheæ contains two genera of half-hardy plants, which, however, may be successfully cultivated outside in a sheltered position. Agapanthus is a handsome plant of easy culture, producing large umbels on a long, nude scape. Agapanthus umbellatus is the generally cultivated species. It is said to have been cultivated at Hampton Court as early as 1692. There are four varieties—umbellatus Mooreanus, a dwarfer form, with more erect leaves; umbellatus Leichtlini, a handsome variety, having large, pale-blue flowers; umbellatus maximus, the largest and handsomest, and there is a white form of this which is desirable, but scarce. The double-flowered umbellatus is of no great merit.

The Tulbaghias are chiefly greenhouse, rhizomatous, perennial herbs, the foliage of which, unfortunately, exudes a distinct alliaceous odour when touched. T. violacea bears erect umbels of violet purple flowers on slender scapes about two feet high. The flowers are very freely produced out of doors in a sheltered position. According to a past Kewite, it should receive nearly aquatic treatment, but the plants on the Palm house terrace cannot be said to receive aquatic treatment, yet they produce flowers freely in July. T. Ludwigiana, from the borders of Kaffir-land, has its outer perianth greenish purple and the inner yellow.

The next tribe (Milleæ) will be treated briefly, for of the five genera included in it two are monotypic, and, with the exception of Brodiaea, they are not generally cultivated. Androstaphium violacea is pretty nearly hardy. It is allied

to Brodiaea, and well adapted for frame culture, yet can safely be grown out of doors. It produces five to six violet coloured flowers in an umbel, borne by a scape 6 inches high, and it is native of Texas.

Also monotypic is Bessera elegans, which, by reason of its variability, has received various specific names. Its flowers are scarlet or white, and attain a height of from 1 to 2 feet, being produced from July to September.

Leucocoryne, a genus of three to four half-hardy species, natives of Chili, requires the same cultural treatment as Ixia. They produce umbels of white, lilac, or blue flowers in July or August. L. alliacea (lilac) and L. ixioides (white or pale blue) are the best species.

Massonia comprises twenty-five species, natives of S. Africa, which are characterised by the presence of a scarious involucre surrounding the umbel. M. pustulata and M. jasminiflora are the best species. Of the genus Daubenya, aurea and fulva are the most interesting species.

TRIBE 5: HYACINTHEÆ.—Here we have ten genera, many of which are spring-flowering plants, characterised by their racemose, rarely spiked, inflorescence. Dipsacis is a genus closely allied to Galtonia, containing both hardy and half-hardy species. For greenhouse culture D. erythraceum and D. hyacinthoides may be selected; whilst D. filamentosum and D. serotinum are adapted for out-of-doors culture.

For greenhouse decoration during spring and early summer Lachenalia are admittedly of vast utility. The genus contains many species, some with erect and others with drooping flowers. To this

A Cottager's Twelve. (See page 491.)

\* A paper read before the Kew Gardeners' Guild by Donald MacGregor.

latter section belong all the popular garden forms. The leaves, which usually number two (although three to four may be produced) are broad, and usually spotted. *L. tricolor*, with green, yellow and red flowers, is the commonest. Its variety *quadricolor* is a more robust form. *L. aurea* is yellow, whilst *L. tricolor aurea* gave the handsome hybrid *Nelsoni*, with flowers of a deeper yellow. *L. pendula* and its variety *aureliana* are at once the handsomest and most distinct of all, producing from twelve to fifteen ruby-red, black-tipped flowers on a raceme.

*Veltheimia*, a genus of Cape bulbs, have long been in cultivation, and may be aptly described as autumn-flowering *Lachenalias*. The species generally cultivated are *V. glauca* and *V. viridifolia*, the latter a beautiful plant for the greenhouse, and seen frequently.

The Grape Hyacinths or *Muscari* comprise forty species, many of which are adapted for planting as a groundwork for deciduous shrubs, or in the front of borders and in rockeries. *M. botryoides* and its varieties are most frequently planted. More robust, but closely resembling this, is *M. Heldreichii*. *M. armeniacum*, which flowers later, is one of the best, producing racemes of dark blue flowers with white "teeth." The Tassel Hyacinth (*Muscari comosum*) produces fertile and sterile flowers on the same raceme, and its variety "monstrosum" has all the flowers barren, and the inflorescence is formed into a dense tuft of slender ramifications. It is pretty, and ought to be in every collection of spring flowering plants. This species, although introduced as early as 1596, is still less planted than it deserves to be.

*Galtonia* (or *Hyacinthus*) is best known to us by that handsome autumn flowering species, *candicans*; whilst the species of *Drimys* are rarely cultivated in any but botanical collections. The pigmy of the Order *Liliaceae* is *Litanthus pusillus*, with thread-like leaves, these decaying before its small, pearly-white flowers are produced. These are borne on scapes about 1 inch high. Grown as clumps in pots, it forms an interesting object in the greenhouse during August.

Coming now to Hyacinths, these are so familiar to all that a description would be superfluous. Of the thirty species, all are natives of the Orient and Mediterranean region, with the exception of three found in tropical and S. Africa. *H. orientalis* var. *albus* is the Roman Hyacinth of gardens, so valuable for forcing. *H. orientalis provincialis*, a native of South France, and *H. orientalis* itself, are the progenitors of all the Dutch or "Garden" varieties. *H. Romanus*, from Italy, is a taller-growing, scentless species, the double white form of which is a desirable plant when forced, to flower at Christmas. The culture of all of them may be classed under two headings, (1) those grown outside; (2) those grown in pots. Number 1 should be planted as early as possible in October. Plant from 6 to 8 inches apart, and to a depth of not less than 4 inches, in a deep, rich loam. Those intended for pot culture should be potted, if possible, in August, the pots being plunged in ashes till they become filled with roots, when they ought to be removed to a cold frame until required for forcing. Their culture in glasses is so common as to require no comment. Some cultivators who use them largely as pot plants for the decoration of drawing rooms employ a compost of moss

Six "Japs" from the Isle of Wight. (See page 491.)

A Dozen Japanese-incurved. (See page 491.)

and charcoal, which, if properly treated, is very effective, as at the time of flowering the moss forms a lovely green cushion-like mass in the pots.

And now to *Chionodoxa*: for planting under deciduous trees and shrubs, or as edgings to shrubberies, beds, or borders (but not for naturalising in grass) these sweet harbingers of spring, together with *Puschkinia*—whose rotate perianths are so much alike—may be treated as one. *C. Luciliae* and its varieties *sardensis* and *gigantea* are the most familiar to gardeners, whilst *Puschkinia scilloides* is also a little gem. *Chiono-Scilla Alleni* is an interesting plant, being a bi-generic hybrid twixt *Scilla bifolia* and *Chionodoxa*.

The *Scilleae* tribe begins a new section—the polyphyllous, characterised by having the segments of the perianth free to the base. This series is represented much more numerous than the gamophyllous, perhaps not by generic, but conspicuously by specific, types. The tribe contains 198 species, seventy-two belonging to the Old World, thirty-two to the Cape, and a few outlying species are found in Hindustan, China, and Japan.

*Urginea*, the first genus of this tribe, is universally known through its species *maritima* (syn. *U. Scilla*), the "Squill" of commerce, largely used in medicine. Do not mistake it for the Squill of spring beds. The bulbs are frequently as large as a child's head, and found 100 miles inland. The name, *U. maritima*, is rather a fallacious appellation. Then we have *Eucomis*, a genus of nearly hardy, and very handsome, plants, thriving in a deep loam, and giving a succession of blooms from March to November. The following are selected: *E. undulata*, *nana*, *amaryllidifolia*, and *punctata*, the latter with its varieties. *Whiteheadia*, which is nearly allied, is rarely cultivated.

Of *Scilla* (English—SQUILL) we have many familiar forms: *bifolia*, *siberica*, and *amena*. These are the earliest, and are succeeded by the ever-present English Blue bell (*Scillanuthans*), or *festalis*, of which both the white and rose-coloured varieties are desirable. Among the early summer flowering ones *hispanica* and its many varieties are the most serviceable. All the half-hardy forms may be started in pots, and planted out when the temperature is suitable, thus securing a greater variety. The same applies to *Ornithogalum*, of which genus we have three distinct types. The first is presented by *O. arabicum*, in which the colour is uniform, and the veining fan-like and inconspicuous; the second by *O. umbellatum*, which has a broad, laxly, many-nerved dash of green down the back of the petals, leaving only a faint white margin. The third type is represented by *O. narbonense*, in which there is only a distinct, narrow green band down the keel on the back. *O. umbellatum* and *narbonense* are the best of the hardy white flowering species. *O. pyrenaicum* is a hardy yellow form, called "Bath Asparagus," the immature flower stems having been sold as French Asparagus by the inhabitants of Bath! *O. thyrsoides* (yellow) and *arabicum*, a fragrant white, with a black centre, may be mentioned among the half hardy forms. *Drimyopsis*, *Camassia* and *Albuca*, each a distinct genus, concludes this tribe. *Albuca* is distinguished by having its segments in two series, three unfolded and three closed over the essential organs.

(To be continued.)

### Bottling Fruit—A Neglected Industry.

A lecture on this subject was given before the Croydon and District Horticultural Mutual Improvement Society on Friday, November 6, by Mr. R. B. Leech, of Wood Hall Gardens, Dulwich. In his opening remarks he alluded to the great waste of fruit which occurs in years of plenty, when perhaps, if the knowledge of preserving became more widely circulated, there would be ample supplies of this valuable commodity for years of famine such as we are experiencing this year, and instead of relying on the foreigner to supply our wants we could well save this expenditure by keeping a good stock of the home made article. The first thing to understand was that decay is carried on by bacterial organisms. Therefore, when commencing to preserve fruit we have to combat this lower form of plant life. The best vessels for bottling, he explained, are some made expressly for this purpose. They are wide at the neck to admit the fruit, and fitted with rubber rings and screw capsules, so that all air is excluded from the fruit when properly sterilised. The vessels are filled with fruit and a syrup made of one pound pure cane sugar, over which a quart of boiling water has been poured, added, and the whole allowed to cool, so that three parts of the fruit in each bottle has been covered. The capsule should be slightly screwed down and the bottles placed in a boiler with cold water reaching half-way up the bottles. The water should then be gradually brought to a heat of 160deg, and kept at this temperature for from ten to thirty minutes, according to the size of the fruit. The maximum time would be sufficient for most fruits that are fairly ripe, although the lecturer recommended using fruit that is not too ripe. The capsules must then be screwed down perfectly tight, and the bottles allowed to cool, being careful not to give them too severe change of temperature, as that might cause them to crack. The bottles could then be stored away for some length of time, and to verify this he exhibited some fruit that he had treated with this process some three and four years ago, and which was perfectly sound. He also dwelt on making jellies, preserved meat and vegetables, adding that during his experience, which extended back about sixteen years, he had found the instructions given in every way satisfactory.

### Hints on Pine Culture.

Successional plants succeed best in span or three-quarter span—roofed pits or small houses properly ventilated, for young stock often suffer irreparable injury at this season from being kept too close and warm, also from being crowded and far from the glass, the plants being drawn and weakly. A temperature of 60deg at night and 65deg in the daytime will keep all young plants gently progressing, admitting a little air at the top of the house at 65deg, leaving it on all day, but not to lower the temperature below that point, and when the sun raises the temperature to 75deg a free circulation of air should be allowed. The bottom heat should be kept steady at 80deg. Avoid anything approaching a damp atmosphere; moderate humidity only is needed at this time of year. Apply water when the plants become dry, and then afford a thorough supply of weak liquid manure. It is essential that the plants be kept well up to the glass and be given plenty of room.

Suckers ready for starting now should be kept until March, and if there is likely to be a scarcity of suckers any recently potted may be retained in 5in pots, affording them a light situation in a rather narrow pit, with a temperature of 55deg at night and a slight bottom heat, keeping them rather dry. Take every opportunity of collecting Oak and Beech leaves, and whenever favourable push forward whatever may be necessary, in the renewing or augmenting the fermenting beds, effecting this without giving a check to the plants.—PRACTICE.

### Figs.

#### SUCCESSION HOUSES.

Prune the trees when the foliage has fallen. Shoots which have reached the limits of the trellis must be cut back to where the succeeding shoots start, in order that they may occupy their places in the coming season. Cut away all elongated spurs, reserving, however, as there is room, a few of those that are short-jointed and fruitful. Loosen the trees from the trellis, thoroughly cleanse the woodwork with soap and water, the glass with clear water, linewash the walls, adding a little sulphur, and wash the trees with soapy water, afterwards dress-

ing them with an approved insecticide, avoiding those containing substances injurious to the bark. Tie the trees to the trellis, leaving sufficient space in the ligatures for the swelling of the branches. Lightly point the border, remove the loose material, supply fresh loam with a sprinkling of bonemeal, and scatter a few sweetened horse droppings on the surface. Ventilate freely in mild weather, only closing when frost prevails.—GROWER.

### Apple Imports.

It is expected that this year the imports of Apples from Canada will reach the unprecedented total of 1,500,000 barrels. This will be about half a million barrels in excess of the previous record, and will form a high watermark which will take some beating in the future. At the same time it can scarcely be said that the limit of importation of the fruit can be reached when picked Canadian Apples are now selling in some of the London fruit shops at as much as threepence each. Something like half a million barrels have come from Nova Scotia alone, and an instance of the enterprise of the Government of that province is afforded by the announcement now made by Mr. Howard, the Agent-General, who states that specimens of the exhibition of Nova Scotia Apples now on view at the Crystal Palace will be loaned to local collections on application to his London office. These Nova Scotian Apples at the Crystal Palace are admirable in size, weight, and high colour.

### West End Fruiterers—A Growing Trade.

The high-class fruit and flower shops in the West End are paying businesses at present, the profits of such trades having much improved of late years. Twenty-five years ago it was generally the custom for wealthy and fashionable people to have their fruit and flowers sent up to their London residences from their country homes, but nowadays people find it more convenient to order their fruit in London, which, of course, benefits the London fruit merchant very largely. Grapes at 10s. per pound and Pears at 2s. 6d. each are a mere jot in the housekeeping expenses of the wealthy Londoner, whilst the development of the high-class restaurant (says the "Western Gazette"), where the dessert costs more than an old-fashioned table d'hôte dinner, has proved a great source of income to the high-class fruiterer, who can now easily afford to pay £1,000 a year in rent for his shop.

### Farmyard Manure.

(Concluded from page 443.)

#### Treatment of Dung in the Field.

To save carting in spring, or to empty the dungstead or the yards, it is a usual practice, in the course of the winter, to form large field storage heaps. Doubtless, in most cases, this practice is thoroughly justifiable, though the fact cannot be overlooked that the opportunities for loss in such heaps are much greater than in a proper dungstead, so that field heaps should only be formed if they are the means of gaining an important end. Where these heaps must be formed they should be placed on firm, level ground, and they should be made as deep and firm as possible. The so-called "draw-heaps," on to which each cart-load is drawn, thereby consolidating the mass, are the best. Subsequently the sides are trimmed up, and the whole should be covered with a layer of soil or ashes about a foot thick. Such a covering consolidates the mass, prevents to some extent ammonia rising into the air, and runs off rain water.

When dung comes to be spread on the land, it should be distributed as equally as possible. Sometimes, unfortunately, one sees great lack of care in this respect. In some districts dung is roughly spread straight from the cart, the finishing touches being subsequently given. In other districts, and more frequently, it is laid down in small heaps about six yards apart. If it is immediately spread, no objection can be taken to the system, though it may be said that if the dung is very old, and especially if it is largely made from moss litter, the spots on which the heaps rest are apt to be left over-manured, and especially is this the case on rough meadows. Too often one sees these small heaps lying for days, and even for weeks, unspread, with the result that the rain washes "the goodness" from the dung into the patches on which the heaps rest. These patches are consequently over-manured, whereas the rest of the field, being supplied with impoverished dung, suffers from insufficient nourishment.

With farmyard manure, even more than with artificials, the farmer should so arrange matters that the quantity of dung at his disposal is distributed over as large an area as is consistent with practical convenience. For instance, twenty tons of dung spread equally on two acres will give a much better return than the same quantity spread on one acre, and yet this rule is often neglected.

As regards the time of year when dung should be applied, much depends on the circumstances of the particular case. By

far the greater quantity of dung goes on to meadows and green crops, and it may be said that in the former case autumn or early winter is the best time to make the application. The complete stocking of the ground with plants obviates much loss of soluble matters by washing. On farms entirely under grass there is no choice but to employ the dung on meadows or pastures, and on such farms it would be bad practice not to cart out all available dung in autumn. Of course, the dungstead will again fill up during winter, and on the whole it is probably better to distribute this additional supply in spring than to leave it in the heap, subject to waste and yielding no return till the following autumn. Late spring dressings, however, unless the dung is very "short"—e.g., dung made with moss litter—interfere with the work of the mowing machine, though this can be avoided by chain harrowing and raking the roughness off two or three months after dressing.

In the case of green crops part of the dung may with advantage be ploughed in during autumn, but only on clean, strong land in a dry district. But if foul and especially strong land has to be cleaned in spring, it will be found that autumn dung, by holding moisture, retards the getting of the land into condition in spring. In any case the work of the cultivator brings much of the dung to the surface, and this, being collected with the weeds, is carted off the land again, or possibly wasted by burning. Farmyard manure ploughed in during autumn will decay more rapidly—and especially so in a mild winter—than if left in the dung-heap, so that a relatively larger proportion will be available for the use of the first crop. But just on this account the succeeding crops will not get so much benefit, and this fact has to be borne in mind in estimating the respective advantages of autumn and spring dressings.

The Board of Agriculture would be glad if recipients of this leaflet would make it known to others interested in the subject. Copies may be obtained free of charge and post free on application to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W. Letters of application so addressed need not be stamped.

## Societies.

### Royal Horticultural, Drill Hall, November 23rd.

The meeting on Tuesday was a small one, and there was no lecture.

#### Floral Committee.

Present: H. B. May, Esq. (in the chair); with Messrs. C. T. Druery, G. Nicholson, Jas. Walker, R. Dean, J. Green, J. F. McLeod, J. Jennings, G. Reuthe, C. R. Fielder, C. Dixon, C. J. Salter, R. C. Notcutt, C. Jeffries, H. J. Cutbush, C. E. Pearson, C. E. Shea, H. J. Jones, W. P. Thomson, E. H. Jenkins, W. J. James, Chas. Blick, E. Mawley, E. T. Cook, and R. W. Wallace.

Messrs. J. Hill and Son, Barrowfield Nurseries, Lower Edmonton, displayed a fine exhibit of specimen Ferns (Silver-gilt Banksian Medal); and from Messrs. W. Cutbush and Son, Highgate, came a pretty exhibit of alpine and herbaceous plants, backed with Conifers. The chief features were the Tritomas, Schizostylis coccinea, Pernettyas in variety, all beautifully berried, Gentiana acaulis, Crocus hyemalis, Campanula muralis major, and Primroses. They also had Carnations (Silver Banksian Medal).

Messrs. W. Bull and Sons, King's Road, Chelsea, contributed a nice display of Epiphyllum delicatum, whose delicate flowers were much admired.

Messrs. Jas. Veitch and Sons, Ltd., Chelsea, occupied a table running the entire length of the Hall with their winter-flowering Begonias. (Silver-gilt Flora Medal.) From Messrs. Barr and Sons, Covent Garden, came a small exhibit of Nerines, Irises, Schizostylis coccinea, and Solanum jasminoides.

Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, staged sixty incurved Chrysanthemums in thirty-six varieties. Needless to add, they were well up to Mr. Higgs' usual form, and truly wonderful for the late period. (Silver Flora Medal.) Mr. J. Russell, Richmond, made a large exhibit of berried and foliage plants. (Silver Flora.)

Messrs. H. Cannell and Sons, Swanley, filled an entire table with an exhibit of Chrysanthemums, Zonal Pelargoniums, and huge plants of Begonias. The Chrysanthemums included specimen flowers of Bessie Godfrey, Mrs. F. W. Vallis, Daniel Lambert, General Hutton, Godfrey's Pride, and Mytilene. The Zonals were superb, both in colour and the size of the flowers. The Begonias were in 6in and 8in pots, large specimens 2½ft high, and at least 2ft through; marvels of cultural skill. (Silver-gilt Banksian Medal.) Messrs. Thos. Cripps and Son, Tunbridge Wells, arranged a semi-circular group of Poinsettias. (Silver Banksian Medal.)

Messrs. W. Wells and Co., Ltd., Redhill, made a fine display

of specimen and decorative Chrysanthemums. The chief of the large varieties were Miss Elsie Fulton, F. A. Cobbold, Harrison Dick, Terra Cotta, Mary Inglis, W. A. Etherington, Donald McLeod, Dora Stevens, Mrs. E. Thirkell, Dorothy Pywell and General Hutton. In the decorative section: Glorious, Nivette, Yellow Souvenir d'une Petite Amie, Elsie Neville, and Harold Shaw were the most conspicuous. (Silver Banksian Medal.) Mr. Geo. Reuthe, Keston, Kent, staged some pretty Nerines, which included the varieties Mrs. Blick, crispa, and elegans alba.

#### Orchid Committee.

Present: H. J. Veitch, Esq. (in the chair); with Messrs. J. O'Brien, de B. Crawshaw, H. M. Pollett, H. Ballantine, N. C. Cookson, J. Douglas, F. Wellesley, F. A. Rehder, A. Hislop, E. Hill, A. A. McBean, G. F. Moore, F. J. Thorne, J. W. Odell, W. Boxall, W. H. Young, M. Gleeson, H. Little, W. A. Bilney, W. H. White, H. T. Tracy, and J. Wilson Potter.

Mr. H. Whateley, Kenilworth, exhibited about a dozen Cypripediums, the best being C. Leeannum, Burford Lodge variety; C. insigne Harefield Hall var., S. insigne Sanderæ, and C. Leeannum giganteum. Mr. F. Wellesley, Woking, staged two Cypripediums, C. insigne citrinum aureum (a beautiful variety, with the upper lip edged with white), also C. i. Westfield variety (a good form with a nicely marked upper lip). From Messrs. Charlesworth and Co., Bradford, came a choice collection.

Mr. F. A. Rehder, Gipsy Hill, arranged a nice collection of Cypripediums. The plants were well flowered and in good condition. From Messrs. Jas. Veitch and Sons, Ltd., Chelsea, came a collection chiefly composed of Cattleyas. The most conspicuous being C. Portia, a lovely form, a cross between C. Bowringiana and C. labiata; C. Elvina, and C. Ixion. L-c. Decia, and L-c. Nysa were also most striking.

A small group of Orchids came from Captain Holford (grower, Mr. Alexander), Tetbury, consisting of large plants of Cypripediums and Lælio-Cattleyas. The chief forms were C. Leeannum Holford's variety, a plant carrying fourteen flowers; C. insigne Harefield Hall variety, a grand piece, for which a cultural commendation was awarded, also excellent plants of C. i. Sanderæ.

A large and choice collection of Cypripediums came from Messrs. Jas. Cypher and Son, Cheltenham, chiefly of the insigne type, some of the best being C. Leeannum giganteum, a fine piece; C. L. magnificum, C. L. aureum, C. L. Burfordense, C. L. Cypheri (a pretty hybrid), C. Leonia, and C. insigne Wallacei, though there were several others worthy of mention.

Messrs. Hugh Low and Co., Enfield, had a few choice forms such as Cattleya labiata grandis, Lælio-cattleya Decia alba, a good hybrid, with Cypripediums in variety, and a good form of Odontoglossum Harryano-crispum.

ORCHID COMMITTEE MEDALS.—Silver-gilt Floras to Captain Holford and Messrs. Cypher; Silver Floras to F. A. Rehder, Esq., and Charlesworth and Co.; Silver Banksians to Hugh Low and Co.; H. Whiteley, Esq.

#### Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the chair); with Messrs. W. Bates, S. Mortimer, J. Cheal, A. Dean, W. Fyfe, O. Thomas, G. Reynolds, J. Jaques, J. Willard, G. Norman, J. McIndoe, A. H. Pearson, G. Wythes, and H. Markham.

Mr. F. Cole, gardener to Sir Chas. Russell, Swallowfield Park, Reading, made a nice exhibit of Grapes. The varieties staged were Cooper's Black, Muscat of Alexandria (good in bunch and well coloured), Black Alicante, and Mrs. Pince. (Silver-gilt Knightian Medal.) Messrs. J. Ambrose and Son, Cheshunt, staged four bunches of the new Melton Constable Seedling Grape. Messrs. B. S. Williams and Son, Upper Holloway, staged a nice-looking Savoy named Williams' Conical. Mr. J. Crook, Ford Abbey, Chard, staged two dishes of Seedling Apples; and Mr. H. Crawley, The Grange Gardens, Sevenoaks, also staged a seedling black Grape.

#### Certificates and Awards of Merit.

Chrysanthemum Mrs. J. Dunn (H. J. Jones).—A fine Japanese variety, described under the awards of the National Chrysanthemum Society's meeting at the Crystal Palace; much whiter on this occasion. A.M.

Chrysanthemum Dorothy Pywell (J. Seward).—Described under the awards of the N.C.S. in this week's Notes and Notices. A.M.

Lady Cranston (W. J. Godfrey).—Described in the awards of the National Chrysanthemum Society, page 487. A.M.

Lælio-cattleya Cassiope (Capt. Holford).—A good form, with pale lilac sepals and petals, the lip purple, with a yellow-veined throat. A.M.

Cypripedium × Queen of Italy (Charlesworth and Co.).—A cross between C. i. Sanderæ and Godefroyæ leucochilum. The upper sepal is pale creamy yellow, white at the top, the lower sepals being spotted, likewise the pouch, though faintly. A.M.

Cypripedium Leeannum, var. Staffordianum (Capt. Holford).—A large, well-formed flower, the upper sepal being white without the spots. The pouch is large and well formed. A.M.

### Chelmsford (Essex), Nov. 10th and 11th.

The third show and first attempt at a two days' exhibition was held in the Corn Exchange, and proved eminently successful. Fruit was much below the average; groups of Chrysanthemums were especially well done. Mr. Rixon, gr. to Captain Cruickshank, Springfield, Lyons, worthily won the Mayor's Cup with a well set up arrangement of fine fresh Chrysanthemums and foliage plants, nicely finished off in front. He was closely pressed by last year's winner, Mr. T. Brazier, gr. to Mrs. W. Gray, Phoenix House; 3, Mr. Symonds, gr. to C. E. Ridley, Esq., The Elms; and 4, Mr. A. E. Lookyer, gr. to Mrs. Jupp, Margeretting. In the small group class, Mr. E. Searles, gr. to Mrs. H. Gray, Laurel Grove, was easily 1st; Mr. Elcock, gr. to Colonel Tufnel Tyrrel 2; and Mr. J. Burrell, gr. to W. W. Duffield, Esq., 3.

Amateurs.—The Cruickshank Cup was most deservedly awarded to Mr. Reed, Roman Road, with a most creditable display; Messrs. C. W. Woodward and W. E. Belcher, both of Mildmay Road, were a good 2nd and 3rd respectively. Mr. S. Pragnell, gr. to H. C. Wells, Esq., D.L., Broomfield Lodge, staged a very large non-competitive group of Chrysanthemums right across the hall, set up in serpentine style, terminating in two huge semicircular mounds at the ends, the whole being faced with small bright-coloured Crotons, Dracaenas, Orchids, and Ferns, and banked up behind with large specimen Palms and other fine-foliage plants. This exhibit won high encomiums, both from the judges and the general public. A large collection of fruit and vegetables staged by the same exhibitor, not for competition, was very highly commended.

Cut blooms.—Open classes: Mr. C. J. Simpson led away with 24 Japanese, which for size, depth, freshness, and colour were grand. This exhibit also gained the N.C.S. certificate for best stand in the show, and the monster F. S. Vallis, 14in across, was the premier Jap. The set comprised Mafeking Hero, F. S. Vallis, Mermaid, Mrs. W. Mease, Godfrey's King, Elsie Fulton, Madame Carnot, and Australia; mid row: Mrs. J. Bryant, Godfrey's Masterpiece, Mrs. Barkley, M. Louis Remy, Chenon de Léché, Edith Tabor, W. R. Church, and Vivian Morel; front row: Madame Herewege, Mr. T. Carrington, Loveliness, George Carpenter, Mrs. G. Mileham, George Lawrence, N.C.S. Jubilee, and Mrs. Coombes. 2, Mr. Rixon. Mr. Simpson was again 1st in the district 24 Japanese with another magnificent set of blooms, almost duplicates of the preceding. Mr. Watmore, gr. to E. Bristowe, Esq., Baddow Park, 2; Mr. W. Wright, gr. to Gerald Ridley, Esq., The Limes, Broomfield, 3. Mr. Brazier was 1st for 12 incurveds, showing neat blooms. Mr. Simpson was 1st for 6 incurveds; 2, Mr. A. Reeve, gr. to Lady Alice Howard, Woodham Walter. Both singles and pompons were well shown, and Mr. Simpson led in the former and Mr. Brazier with the latter. In the amateur open classes, 12 Japanese, Mr. Reed was 1st. Mr. Reed led also with 12 incurveds; C. H. Curtis in this stand was awarded for best incurved in the show. Mr. Rippon had much the best 12 Japanese grown in the district. This stand was adjudged the best stand shown in the amateur classes, and gained the N.C.S. certificate. It comprised fine blooms of George Lawrence, W. R. Church, Bessie Godfrey, Mrs. Greenfield, Lily Mountford, Godfrey's King, Lord Ludlow, and Alice Byron.

Mr. Searles showed the best collection of fruit; Messrs. Sitch, Falconer, Searles, and J. Tunbridge the best vegetables. A long table of ladies' floral decorations was a good feature. Mrs. Leech 1, Miss A. Marriage 2, Miss Luckin 3, were winners.

### Nottingham and Notts., Nov. 13th and 14th.

This society held its annual show on November 13 and 14. The number and quality of the exhibits marked it as the best show yet held. This was exceedingly gratifying, as local growers had an immense number of exceptionally good blooms destroyed before being fully developed. The judges—Mr. Weeks, gr. to Lady Byron; Mr. Tallack, gr. to E. M. Mundy, Esq., of Shipley Hall; and Mr. C. Mee, of Nottingham—were occupied five hours in making their awards, which, by the way, gave complete satisfaction. The opening ceremony was graciously undertaken by Mrs. John Robinson, of Worksop Manor. The president, Mr. Alderman Bennett, took the chair, and was supported by John Robinson, Esq., the Mayor (Councillor A. Page), and the Sheriff (Councillor Fleeman), of Nottingham, together with numerous aldermen, councillors, ladies, and gentlemen of the city and county. In his opening remarks the president made the welcome announcement that John Robinson, Esq., on behalf of Mrs. Robinson, had promised an exceedingly handsome donation to the society.

The exhibits were most artistically arranged, under the skilful superintendence of Mr. Arthur Staton, and the hall was transformed into a veritable bower of floral beauty. The centre of the hall was occupied by a gigantic Palm, lent by Mr. C. Mee, and was encircled by bouquets, epergnes, and sprays, the whole being surrounded by exhibits of fruit, the quantity, quality, and appearance of which caused people to wonder if the year 1903 had really been the bad fruit season it has been proclaimed.

An exceedingly well-coloured exhibit of cooking Apples attracted special attention, but it failed to gain an award owing to some of the fruit having been bruised in transit. The front of the orchestra was beautified by a number of florally decorated fire-places, one of the new features of this year's schedule. The attractiveness of the show was enhanced by a splendid non-competitive collection of fruit, vegetables, and flowers staged by Mr. Weeks, gr. to Lady Byron, and for which collection the committee awarded a special gold medal. Mr. Hemstock, gr. to A. Orgill, Esq., of Nottingham, assisted in adding to the floral beauty by putting up a fine collection of resplendent Orchids. The attendance was a capital one, the gate constituting a record, and altogether the secretary, Mr. G. E. Skelhorn, is to be congratulated on the success attending his first year of official connection with the society.

Of the competitors, the gr. to W. A. H. Bass, Esq., of Burton (Mr. Richard Nisbett, who has met with such constant success at the various provincial shows recently), was very successful. Entering in three classes, he secured two 1sts and one 2nd, and also the award for the champion Japanese bloom with Princess Alice de Monaco. In addition, he gained the National Society's certificate. The winner of the prize for the champion incurved bloom was Mr. W. Whithead, a local artisan. Mr. J. H. Goodacre, gr. to the Earl of Harrington, was extremely successful, gaining eight 1sts, two 2nds, and two 3rds. Mr. G. Wright gained three 1sts and six 2nds. Mr. R. J. Walters, gr. to Mrs. Leavers, of Nottingham, gained one 1st, five 2nds, four 3rds, one 4th, and carried off the Championship Shield offered by Messrs. Toogood and Sons, of Southampton; whilst Mr. W. Parkin, a local artisan, and exhibitor for the first time, gained the Toogood bronze medal, and also the National Society's certificates with three 1sts, two 2nds, five 3rds, and one 6th. Mr. Yarnell, gr. to Mr. Turner, of Nottingham, entering in six classes, gained four 1sts and one 4th. Mr. John Burley, another local artisan, gained two 1sts, four 2nds, two 3rds, and three 4ths, and Messrs. Toogood and Sons' certificate. Mr. T. Barratt, a local florist, two 1sts, two 2nds, and three 3rds, and there were a few other prizewinners.—S. D.

### Sparkhill, Nov. 14th.

The first Chrysanthemum Show of the Sparkhill and District Amateur Horticultural Society was held in the handsome Streetford Road Council Schools on the above date, when a really meritorious exhibition was presented. The show was under the management of the urbane and energetic hon. sec., Mr. W. W. Staples, and his committee. The show was opened by the president, J. J. Platter, Esq., who, though blind from the sixth year of his age, delivered a most eloquent address. The venerable gentleman afterwards was conducted round the show, and evinced the greatest interest in the qualities of the exhibits described to him. The cut blooms in the open classes were of high quality, especially a collection of Japs sent by Mr. R. Jones, gr. to C. A. Smith-Ryland, Esq., Barford Hill, Warwick.

### Belfast, Nov. 17th and 18th.

SUMMARY.—The annual autumn show of the Ulster Horticultural Society, held in the St. George's Market, Belfast, proved most successful, fine weather for once in a way adding considerably to the comfort of the numerous visitors. The opening ceremony was performed by the Countess of Kilmorey, a large and distinguished company being present, among whom were Lord Newry, Lord Dunleath, the Right Hon. Thos. Andrews, D.L., Sir Otto and Lady Jaffe, Sir Robert Anderson, Mrs. Pirrie, Miss Carlisle, and many other well-known ladies and gentlemen. Considering the unfavourable season for most things there were a large number of entries. Among the Chrysanthemums (which were the principal feature of the show) many excellent exhibits were staged.

CUT BLOOMS.—Twenty vases Japanese, 12 varieties: 1, Captain Stirling, Keir, Dunblane; 2, John Jamieson, Esq., D.L., St. Marnocks, Malahide. Twelve Japanese in vases, 12 varieties: 1, The Countess of Caledon; 2, G. H. Browne, Esq., J.P. Forty-eight blooms, Japanese: 1, John Jamieson, Esq.; 2, Thos. H. Torrens, Esq. Twenty-four blooms, Japanese, distinct: 1, G. H. Browne, Esq.; 2, Colonel the Hon. C. F. Crichton; 3, Lord Dunleath. Twenty incurved: 1, Thos. H. Torrens, Esq.; 2, Lord Dunleath. The entries in all the classes—for cut flowers, plants, fruit, vegetables, farm produce, and butter—were numerous and excellent in quality.

The trade exhibits (always appreciated) were undoubtedly finer this year than ever. The stand of Messrs. Alex. Dickson and Sons, Limited, a winged screen of ivory-coloured wood with panels of green silk, formed a background for the arrangement of a large number of exquisite designs. The central device was striking and ingenious. It was the finest stand in the show, the designer of which is worthy of the highest praise for the make-ups and arrangement.

Upon Messrs. Smith and Co.'s stand also were many beautiful designs, the most striking being a large broken column on a pedestal, made of white Chrysanthemums, with sprays of Ivy

clinging to it. An Irish harp, Shamrocks, crosses, lyre, and some bouquets completed a very creditable exhibit.

Fine exhibits of fruit were staged by Messrs. A. Dickson and Sons, Limited, and Mr. Hugh Dickson, Belmont. Many other worthy exhibits were put up by local firms and from across the water. Space will not allow anything but a note or two of description of the many pleasing features which made this show one of the finest of the season. Suffice to say that a large number of entries, a brilliant company, pleasing music, and good weather combined to make a visit to this show one of great pleasure.—J. W. J.

### Dumfriesshire and Galloway, N.B., Nov. 18th.

The new departure of the above society in holding a show of Mums was so far satisfactory that it is to be hoped that an effort will be made to constitute it an annual event. The Drill Hall, Dumfries, is a capital place for such a show, and the turnout of flowers and plants showed that the gardeners and nurserymen of the district are prepared to support it heartily. Cut blooms were very good, and Messrs. Jas. Service and Sons were 1st in the open class for 36 blooms, 18 blooms, and 12 blooms with really fine flowers of great size and finish. In the gardeners' classes for cut blooms there was difficulty in judging in those for 18 Japanese and 12 Japanese between Mr. J. Duff, Threave, Castle-Douglas, and Mr. J. Harcastle, Holm Hill, Dalston, Carlisle; but the judges considered those of Mr. Duff the better in both classes. In the gardeners' cut bloom classes, as a whole, however, Mr. Harcastle took such a good position that he won Mr. H. J. Jones' silver-gilt medal for the winner of most points. Mr. Jas. Henderson, Elmbank, Dumfries; Mr. M. B. McDonald, Langholm; and Mr. R. Young, Gracefield, Dumfries, were the other leading winners in these classes, the latter being 1st for a basket of Chrysanthemums. Plants were good upon the whole for a group. Messrs. Service led; 2nd, Mr. J. Houston, Crichton Royal Institution, who set up a tasteful group of smaller flowered plants. Fruit and vegetables were not so strong as they might have been, Mr. Duff leading with Apples, and Mr. J. M. Stewart with a collection of Pears and Apples. Mr. Houston won for a collection of vegetables, and Mr. J. M. Stewart, Mr. W. Muir, Summerville, Dumfries, and Mr. R. Young, Gracefield, Dumfries, were the other principal winners in these classes. The nurserymen's exhibits were very good, certificates being awarded to T. Kennedy and Co. for plants; W. Middleton and Son for trees and shrubs; Kerr Brothers for new Potatoes of their own raising; Fotheringham and King for Palms; Mr. W. Byers for a table of plants, and also for a table of fruit; and Mr. Jas. Kennedy for plants. Sir M. J. McTaggart Stewart Bart., M.P., opened the show with a most interesting speech.—SOLWAY.

### Bristol, Nov. 18th and 19th.

The fortieth exhibition of the Bristol Chrysanthemum Society was held in the Colston Hall on the above date, and was quite up to the average in most respects. The fruit and vegetable classes, as may be expected, were very weak, the fine show of Apples, Pears, and other fruit usually seen at Bristol being missed. Cut blooms were well up to the average, and few finer stands than that with which Mr. F. S. Vallis won have been seen this season. This noted grower, with 36 Japanese, not only won outright the Challenge Vase, but also the National Society's silver medal for the best bloom in the show (a superb F. S. Vallis), and a local prize given for the best exhibit of cut blooms. The 36 were made up from the leading kinds. Mr. H. O. Lord (gr., Mr. May) was 2nd; the Frome Fruit and Flower Company, Mr. Taylor, and Mr. G. Runnacles following in the order named for the remaining prizes. Having previously won the cup two seasons, Mr. Vallis now becomes the possessor of it.

Mr. G. W. Drake led in the principal class for incurved flowers with a meritorious stand, but this section was not by any means up to the usual Bristol form, and one missed several well-known exhibitors. The first prize and silver medal for a group of Chrysanthemums was taken by Mr. J. C. Godwin, his gr., Mr. J. McCulloch, putting a lot of very fine material into a group, the only fault of which is its hard outline and rather crowded condition. Mrs. Vincent Ames, Mr. Howell Davies, and Dr. Eager were other successful competitors in the group classes.

Orchids were particularly well shown, splendidly flowered specimens of *Cattleya labiata* and *Lælia præstans* being noted. Specimen Chrysanthemum plants were very weak, but among the ornamental foliage plants there were a few very fine pieces, notably a grand *Cycas revoluta* and *Croton Victoria* in the 1st prize half-dozen set up by J. B. Woods and Son, of Chipping Sodbury. Specimen Ferns were good, Mrs. Ames leading in the class for 6, closely followed by Mr. C. Godwin. Fruit calls for no special mention, but the table decorations, bouquets, and wreaths were splendid. Mrs. Rogers won 1st for bouquet, and for a wreath was 3rd. More than one experienced florist thought her rather unfortunate in taking only 3rd. O. Dobson and Co. and Mr. Coles were 1st and 2nd here.

Trade exhibits were numerous and fine. Messrs. Sutton and

Sons, of Reading, Garaway and Parker and Sons, of Bristol, Blackmore and Langdon, of Bath, Godfrey, of Exmouth, and Wells, of Redhill, all staged of their best. The Bristol Amateur Society held their annual show in connection with that of the older society, and made a very creditable display in the lesser hall.—H. R. R.

### Sutton Coldfield (Warwickshire), Nov. 18th and 19th.

The eighteenth annual show was held in the Masonic Hall on the above dates, and the quality throughout was good. Vegetables in particular were of high merit. Chrysanthemums and dinner-table decorations were prominent features, as also a large collection of well-grown, large Onions exhibited by Mr. Albert Jeffs, gr. to E. Ansell, Esq., Rigby Hall, Bromsgrove. A certificate of merit was accorded Mr. T. B. Grove, Wyndley Nursery, Sutton Coldfield. It is only just to remark that the arrangements of the show were methodically carried out by Messrs. J. N. Brown (secretary) and G. T. Grove, junior, the chairman. There were two groups or banks of Chrysanthemums arranged for effect. For 12 Japs Mr. A. Jeffs won 1st honours with an excellent complement. The 2nd prize by Mr. C. Link with a creditable lot. Primulas were finely staged by Mr. W. Jones, his 12 plants gaining the 1st prize. For 6 table plants, distinct, Mr. J. Bampton secured 1st. The competition for a collection of vegetables, Mr. J. Jones, gr. to L. Turner, Esq., was the victor with a capital lot; 2, Mr. R. T. Parker, The Gardens, Moor Hall.

### York, Nov. 18th, 19th, and 20th.

SUMMARY.—In the Exhibition Building the annual show was held, and was in every way a pronounced success. The building is one of the best in the United Kingdom for a display of this kind, being light, elegant in appearance, and providing ample space to display the exhibits thoroughly, and, at the same time, giving ample space to view them. Cut blooms were, perhaps, not quite so numerous as in some seasons past, which is not a singular case this year. What they lacked in quantity was amply made up in quality. Groups of Chrysanthemums and miscellaneous subjects were—as they always are here—of a first-rate order of merit.

The management here is quite of the best, under the careful supervision of Mr. F. Oman, the courteous secretary, aided by an enthusiastic committee of practical men. Mr. W. Higgs was 1st for 36 blooms, half incurved and half Japs.; and Mr. J. Folkard came second. Mr. Higgs also led for 18 incurveds.

CUT BLOOMS created the most interest, many handsome prizes being offered. The leading class was that for 36, half to be incurved and the remainder Japanese in not less than 12 varieties of each, nor more than two of any one variety. To the "Citizens' Challenge Prize, valued at £20, £10 was offered for the premier exhibit. Four competed, making a fine display. Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, was an easy 1st prize winner by the great superiority of his incurved blooms, which were large, shapely, and well staged. The Japanese were lighter, still possessing high quality. The names were:—*Incurved*: Duchess of Fife (2), Ralph Hatton, W. Higgs (2), Mr. Judson, G. W. Matthew, Miss Nellie Southam, Frank Hammond (2), Mdle. Lucie Faure, Egyptian (2), C. H. Curtis, E. Lock, Ma Perfection, Mrs. B. Hankey, and Mrs. W. Higgs. *Japanese*: Bessie Godfrey, Godfrey's Pride (2), Mrs. J. Lewis, W. R. Church (2), Lord Ludlow, Mafeking Hero, Le Grand Dragon, Marquis V. Venosta, Mrs. Mease (2), Kimberley, George Penford, Mrs. Mileham, General Hutton, Mdme. P. Radaelli, and Mrs. Hamwell. Mr. J. Folkard, gr. to Lady Walker, Sand Hutton, was a good 2nd, with handsome Japanese, but smaller incurved. Mr. W. Mease, gr. to A. Tate, Esq., Downside, Leatherhead, was a close 3rd.

For 18 incurved, Mr. Higgs, with an exceedingly fine stand of heavy, well finished blooms, was an easy 1st prizetaker. Especially noteworthy was Mrs. Judson, W. Higgs, Duchess of Fife, Ialene, May Phillips, Frank Hammond, and Comtesse d'Esteile. Mr. Mease was a good 2nd; Mr. J. McPherson, gr. to Lord Londesborough, Londesborough Park, Market Weighton, a close 3rd; five competed. The latter won the premier award for 12 incurved, with medium-sized neat blooms, such varieties as Duchess of Fife, Fred Palmer, J. Agate, Louisa Giles, Hanwell Glory, C. H. Curtis, and Baron Hirsch were well represented. Mr. G. E. Thomas, gr. to the Marquess of Ripon, Studley Royal, Ripon, was a close 2nd. Mr. Folkard 3rd. Mr. McPherson also won for 6 incurved distinct. Mr. Folkard a close 2nd, with Mr. Everard, gr. to Mrs. Guich, Holgate Lodge, York, 3rd. For 6 incurved, any one variety, Mr. G. W. Richardson, gr. to G. W. Whitehead, Esq., Deighton Grove, York, was 1st with small neat blooms of Hanwell Glory, Mr. McPherson following with Topaze Orientale, large but loose. Mr. A. W. Whitlock, Monkton Lane Nurseries, Ripon, 3rd with C. H. Curtis.

Japanese made a good display, so numerous were they. For 18 distinct Mr. McPherson was the most successful, with a stand

of heavy blooms, richly coloured and well staged. Mrs. Barkley, M. Chenon de Leche fine, Vivian Morel, Mrs. J. C. Neville, Bessie Godfrey, rich, Florence Molyneux, Ethel Fitzroy, Mrs. Greenfield, Gustave Henry, Mrs. Mileham, General Hutton, J. R. Upton, W. R. Church, and Mdme. P. Radaelli as the most noteworthy. Mr. D. Williams, gr. to the Earl of Feversham, Duncombe Park, Helmsley, 2nd with a capital set. Lily Mountford and Mrs. F. W. Vallis were exceedingly good. Mr. Mease 3rd with smaller blooms; five competed. Mr. McPherson followed up his previous success by securing, amongst 8 competitors, the premier award for 12 varieties. W. R. Church, Genl. Hutton, Mrs. Barkley, Mrs. Mileham, Mdme. Heneage, Mrs. Greenfield and *Australie* were extra fine. Mr. Williams followed closely with *Princess de Monaco*, exceedingly fine petal, as the most noteworthy; Mr. Folkard 3rd. Messrs. McPherson, Williams and Folkard secured the prizes for 12 Japanese distinct in the order here given, all staging most creditably. For 6 any white variety there was keen competition. Mr. D. Williams, with *Gustave Henry* in splendid condition, secured the leading award. Mr. McPherson 2nd with the same variety. Mr. J. Adams, gr. to Miss Chapman, Otley Road, Harrogate, with *Nellie Pockett*. There was keen competition for 6 any one yellow variety, Mr. McPherson winning with Mrs. Greenfield, especially rich in colour. Mr. Williams, with medium sized *Edith Tabor*, following. Mr. R. Harrison, gr. to — Monkhouse, Esq., *The Laurels*, Bishopsthorpe, 3rd. Six sets of six, any one variety except white and yellow, were present in that section. Mr. McPherson, with large but rough examples of W. R. Church, won the premier place. Mr. Folkard, with Mrs. Mileham, 2nd.

Single flowered varieties, in sprays of three each of six distinct, made an attractive class. Messrs. Theakstone and Sons, Hull Road, York, won with a charming display. Mr. A. W. Whitelock, Monkton Lane Nursery, Ripon, 2nd. Mr. Murchison, gr. to J. B. Grotian, Esq., *Wetherby*, 3rd. The last-named was the only competitor for 12 *Anemone* flowered, he winning the premier award with excellent examples of *Descartes*, *John Bunyan*, *Sabina*, and W. W. Astor. Decorative varieties in sprays of three each were a great feature, as they always are here. For twelve vases five competed. Messrs. Theakstone and Son were distinctly ahead of all others with high quality flowers of *Ernest Fierens*, *Soliel d'Octobre*, *Lizzie Adecock*, *La Triomphante*, *Bessie Chapman*, *Source d'Or*, *Mytchett Beauty*, *Pride of the Market*, *Eynsford White*, and *Caprice du Printemps*. Messrs. G. Longster and Son, Beverley Nursery, Malton, was 2nd. F. Styan, Esq., York, 3rd. For a basket of Chrysanthemums arranged with their own foliage no fewer than ten competed, making a grand display. Mr. J. Yates, 51, Bewley's, Grove Street, York, was 1st with an effective combination of large and small flowered varieties. Mr. J. S. Holmes 2nd with a grand mass of *Source d'Or*. Mr. Styan 3rd. For a vase arranged with Chrysanthemums suitable for a drawing-room there was keen competition. Mr. J. T. Holmes, Clifton, York, was 1st with *Source d'Or* splendidly arranged. Messrs. Longster and Sons 2nd. Local classes and the amateurs' division were well filled with creditable produce. Space, however, forbids a detailed account.

**PLANTS.**—The classes for groups of various kinds always attract much attention here, so handsome are the prizes and good the results. For a group of Chrysanthemums interspersed with foliage plants arranged for effect in 100 square feet, £10 was offered for first prize. Three competed, the premier award going to Mr. W. Townsend, gr. to E. B. Faber, Esq., M.P., Harrogate, for handsome Chrysanthemums and good foliage plants, but exposing too many of the stakes and pots in arrangement. Mr. G. Jarvis, gr. to Mrs. Whittaker, Cliffe House, Bessie, 2nd, with a much better arrangement, but lacking in quality of the Chrysanthemums. Mr. Cottam, Alma Gardens, Cottingham, 3rd. For the best decorated pillar, 17ft high, with Chrysanthemums and foliage plants, on a base of 8ft by 6ft, Messrs. R. Simpson and Sons, Brook Street, Selby, were awarded the premier place with a pleasing arrangement of single flowered Chrysanthemums up the pole, nicely interspersed with *Crotons* and *Palms*. The Chrysanthemums at the base, however, were a little small. Mr. Jarvis 2nd.

Much the best group, however, in effect was one from the Rev. G. Yeats, Heworth Vicarage, but which unfortunately was not high enough; the judges had to, however reluctantly, disqualify it. A similar class in some respects was that for a decorated pillar with a mirror in the centre. Here a fine effect was produced by the three exhibitors. Messrs. R. Simpson and Son were an easy 1st with a light yet effective arrangement of single Chrysanthemums, finely coloured *Crotons*, with an exceedingly fine basket of *Asparagus Sprengeri* at the top. The whole was pleasingly designed and carried out. Mr. Cottam 2nd. Mr. J. Key, Clifton Nursery, 3rd. For a group of Chrysanthemums arranged for effect in 80 square feet, Mr. J. Pettinger, Franklin Square Nurseries, Harrogate, was easily 1st with plants ranging from 1ft 6in to 5ft in height, well clothed with foliage, and carrying good blooms. Mr. J. W. Hields, Front Street, Acomb, York, 2nd.

Specimen plants were not numerous. Mr. Everard was easily first for four incurveds, showing C. H. Curtis, Mrs. G. Rundle, G. Glenny, and Lord Wolsley. Mr. J. W. Backhouse 2nd. For 4 Japanese Mr. Everard also won with good examples in every way of John Shrimpton, Swanley Giant, Lady Hanham, and *Souvenir de Petite Amie*. Mr. T. Mitchell, *Dernier House*, Dringhouses, York, 2nd. Single flowered varieties were well staged. Mr. Everard, with a freely flowered plant of Miss A. Holden, won for a specimen, as also he did for one Japanese with a capital example of Lady Hanham. Amateurs staged well, many meritorious examples being seen.

For the best decorated dessert table with Chrysanthemums only and foliage, Miss Whitehead, Deighton Grove, York, won the coveted award for an arrangement of single flowered pink blooms effectively disposed. Miss Hall 2nd. Mrs. Palmers 3rd.

Messrs. W. Cutbush and Son, Highgate Nurseries, had a gold medal awarded for a fine display of *Azalea mollis*, *Lilium lancifolium roseum* and *album*, *Carnations*, &c., all most beautifully arranged.

Messrs. Clibran and Son, Altrincham, had a capital display of single Chrysanthemums and *Celosias*. Among the former Miss F. Wilcox (white, flushed pink), Miss T. C. Warden (pure white), Mrs. R. M. Parker (clear yellow), and Mrs. E. Roberts (lilac) were conspicuous.

### Edinburgh, Nov. 19th and 20th.

**SUMMARY.**—This association dispenses with stands, cups, and tubes, and is the pioneer of the vase method of staging Chrysanthemum blooms. No fewer than 611 vases were required, and 1,833 blooms were staged. So much as £340 were paid for the band for the three days. Mr. D. Nicol, of Forgandenny, won 1st for the 20 varieties of Japs. 3 of each, in vases, Mr. T. Lunt coming second, and Mr. J. Beisant third. The "Queen Alexandra Prize" was awarded to flowers which were inferior to many stands in the open classes. The display was certainly inadequate for the prizes. Nine competed for the Scottish Challenge Cup, and Mr. W. Nicholson, Strathallan Castle, was 1st. The show was of the highest order of excellence.

It is safe to say that the Scottish Horticultural Association was the pioneer society of the vase method of displaying the large Chrysanthemum blooms by offering valuable prizes. It must be pleasing to that society to find that the show recently held under that management is still the best in the United Kingdom. No society can boast of such a display as that held in the Waverley Market on the dates named. No fewer than 611 vases were required to contain the blooms, and as three blooms in each vase was the rule, no fewer than 1,833 blooms were staged in this manner alone. This association, too, has discarded the stands, cups, and tubes, and without regret; thus they are pioneers in this respect also. The show in question was on the whole a magnificent display in a capacious building such as is the Waverley Market Hall. No other site is equal to this for accommodating the vast numbers who flock to the shows annually. The executive deserve well of the public, as it would be difficult to find a more enterprising body. For instance, what other society would care to pay £340 for music for the three days? The society is managed by practical men, under the presidency of Mr. McHattie, the city's gardener, ably aided by efficient committees, and an admirable secretary in Mr. Loney, and a capable treasurer in Mr. Mackinnon.

**VASE CLASSES.**—No fewer than twenty classes are provided. The principal one is that for 20 varieties of Japanese, three blooms of each, and for which the handsome prize of a piece of plate value £20, and £10 in cash, is offered for the first prize, with sums of £20, £15, £10, and £5 in four other prizes. Such encouragement as this is deserving of success in competition. On this occasion five competed, making a fine display. Mr. D. Nicol, gr. to J. W. Bell, Esq., Rossie, Forgandenny, secured the coveted award with handsome, massive examples of the following: *H. Stowe* (very fine), *Duchess of Sutherland*, *Gustave Henry*, Mrs. Mileham, Miss Olive Miller, F. S. Vallis, *Madame Paolo Radaelli* (deeply built), Miss A. Byron, Lord Ludlow (magnificent), *Nellie Pockett*, Mrs. F. W. Vallis (richly coloured), *Lady Conyers*, *Mildred Ware* (rich), Mrs. Barkley, Mrs. J. Bryant, *Bessie Godfrey*, *Madame Cadbury*, Mrs. G. Lawrence, J. R. Upton, and *Edith Shrimpton*. Mr. T. Lunt, gr. to Captain A. Stirling, Keir, Dunblane, was a good 2nd, with not too large, but handsome, fresh examples, showing much quality. Especially fine were *Bessie Godfrey*, Mrs. Mileham, *Madame Herreweghe*, *Madame Cadbury*, *Elsie Fulton*, and Mrs. E. Hummell. Mr. J. Beisant, The Gardens, Castle Huntley, was an exceedingly close 3rd, with massive blooms, some a trifle stale. Mrs. F. S. Vallis was a monster, fully 11in in diameter. *Henry Perkins* (very rich), *Florence Molyneux* (massive), *Mildred Ware*, and *George Penfold* were especially noteworthy. Mr. J. Martin, gr. to Mrs. Swinburn, Corndean Hall, Winchcombe, Gloucestershire, 4th. Mr. R. Kenyon, gr. to J. R. Twentymen, Esq., Monkhams, Essex, 5th.

What is known as the "Queen Alexandra" prize was this year offered for 12 vases Japanese, three of each variety in a vase, and for which the sums of £15, £10, £7 10s., and £4 were

offered as encouragement to growers within the municipal boundaries of Edinburgh and Leith. Five competed, but the display was certainly inadequate for the valuable prizes offered. The premier award was certainly below, in point of quality, many stands in the open classes that failed to obtain an award. Mr. D. Cavanagh, gr. to J. C. Oliver, Esq., Murrayfield, won the 1st prize with small blooms of popular varieties. Mr. J. Fraser, gr. to G. B. Turnbull, Esq., Kilravock, 2nd; Mr. W. Lamont, gr. to Rev. R. McNair, Brizlee, 3rd. Five competed.

No fewer than nine competed for the Scottish Challenge Cup and £10 as 1st prize, with handsome prizes for four others. For 12 vases Japanese, three blooms in each, distinct varieties, Mr. W. Nicholson, gr. to E. Whitelaw, Esq., Strathallan Castle, Machany, quite easily won the coveted award with blooms quite equal to any in the show. The varieties were Princess Brancova (9in deep), Madame Paolo Radaelli, Mafeking Hero, Mrs. J. Bryant, Calvat's Sun, Bessie Godfrey, Miss Olive Miller (very fine), Mrs. Mileham, Kimberley, Florence Molyneux, J. R. Upton (massive), and Australia. Mr. J. H. Cumming, gr. to Lady Stewart, Grantully Castle, a good 2nd. Mr. W. J. Norman, gr. to the Earl of Mar and Kellie, Alloa House, 3rd.

The following classes are open to private gardeners and amateurs. For six varieties, three of each, nine took part, the best coming from Mr. Beisant, even, high-class blooms of the following: Florence Molyneux, Mrs. Mileham, Madame P. Radaelli, Mrs. Barkley, Duchess of Sutherland, and Australia. Mr. Lunt 2nd, Mr. Nicol 3rd. Thirteen competed for six blooms, one variety, three in each vase. Mr. W. Simpson, gr. to Captain R. G. G. Wemyss, Wemyss Castle, Fife, was an easy 1st with extremely fine examples of Bessie Godfrey. Mr. D. Kidd, gr. to Lord Elphinstone, Carberry Towers, 2nd, with high quality blooms of Mrs. Mileham. Mr. Kenyon 3rd. In the class for 12 distinct varieties Japanese, three blooms in each vase, no fewer than fifteen took part. Mr. Nicholson secured the first place with representative examples of popular varieties. Mr. D. Nicol 2nd, with Mr. J. Cumming 3rd. For the prizes offered by Mr. Godfrey for his novelties there was not much competition, Mr. Lunt winning with fair blooms of Bessie Godfrey, Loveliness, Queen Alexandra, Grandeur, and Sensation as the best. Mr. R. W. E. Murray, Blackford House, a close 2nd.

Two classes were provided for incurved varieties in vases. For six blooms, any one variety, five competed. Mr. J. Boucher, gr. to H. E. Gordon, Esq., Aitkenhead, Cathcart, won with J. Agate, very neat. Mr. J. Wood, gr. to The Hon. Mrs. Hamilton, Dunmore Park, Larbert, 2nd, with C. H. Curtis. Mr. J. Martin 3rd with the same variety. For two varieties, three blooms of each, Mr. Martin won with ordinary flowers of well-known sorts.

Single flowered varieties receive much encouragement. For three varieties, with any kind of foliage, and any number of sprays, Mr. A. Knight, gr. to Sir W. Lawson, M.P., Brayton, Carlisle, had the best of five exhibits, staging Mary Anderson, Miss A. Holden, and Purity very attractively. Mr. D. Kidd, with Edith Pagram, Purity, and Perfection, 2nd. Mr. J. Hay, gr. to Mrs. W. Foster, Houghton Hall, Carlisle, 3rd. In the class for three vases decorative varieties, distinct, with not more than eighteen sprays in each, there was brisk competition and a fine display. Mr. Macgregor, gr. to R. H. Elliott, Esq., Clifton Park, was 1st among nine competitors with handsome groups of La Triomphante and its yellow sport, and an attractive red variety which we failed to get the name of. Mr. J. Holmes, gr. to Mrs. H. Ogilvy, Winton Castle, 2nd, with Mr. T. Baird, gr. to J. Younger, Esq., Arnbrae, Cambus, 3rd. Bouquets and baskets of flowers were a capital display, and so were the amateurs' division well represented.

The premier Japanese bloom of the show was a magnificent one of Miss Elsie Fulton, from Mr. T. Lunt, this bloom measuring 9in wide, 8in deep.

The society's silver medal was awarded to Mr. R. W. E. Mundy for Japanese Chrysanthemum "Lady Cranston" as being the best new variety not in commerce. This is indeed a gem, a sport from Mrs. Barkley. It has long drooping florets, some 1in wide, well built up in the centre. In colour it is pleasing; the centre is faint rose, gradually shading to almost white at the tips. The bronze medal was awarded to Dora Stevens, rose terra-cotta, a well built Japanese, belonging to Messrs. Wells and Co., Earlswood.

Plants were a distinct improvement upon last year. For six specimens distinct Mr. Ruleman, gr. to D. R. W. Huie, Esq., Hollywood, Colinton Road, was 1st with freely flowered examples of Souvenir d'une Petite Amie, Vivian Morel, and J. Shrimpton. Mr. W. G. Michie, gr. to Sir J. Steel, Bart., Boroughfield, 2nd. Mr. Ruleman was also 1st for four plants, not disbudded. Mr. W. Michie won for 4 Japanese with capital specimens of J. Shrimpton, Vivian Morel, and Souvenir d'une Petite Amie. Mr. Ruleman 2nd. Excellent were the plants confined to 6in pots. For 6 Japanese Mr. J. Fraser was first with such varieties as Soleil d'Octobre carrying one and half a dozen blooms. In a similar class for Pompons Mr. Ruleman won. Groups of Chrysanthemum called for little comment.

To encourage what is known as trade floral exhibits the association offered £20, £15, and £10 for the most meritorious exhibit of bouquets, baskets, &c. There was but one exhibitor, an extensive and beautiful display of floral designs by Messrs. Todd and Co., Shandwick Place, Edinburgh. In the centre of the group was a grandfather's clock, 7½ft high, executed in bronze Chrysanthemums, resembling mahogany, and panelled with Violets, richly ornamented with Alexandra Orchids and Safrano Roses. The dial was in white Chrysanthemums, and lettered with petals of white Chrysanthemums on green Rose leaves. The clock kept good time during the show, and was greatly admired. A mariner's wheel 4ft in diameter, was also a prominent figure in the exhibit, executed in yellow and bronze and ornamented with Cattleyas and Safrano Roses. An upright cross, 5ft high, in white, and sprayed with Cattleyas, and a broken column, in white, beautifully decorated with Liberty red and Bridesmaid pink Roses, were also very noticeable. Many other designs and a number of exquisite bouquets made up one of the most charming exhibits probably ever seen at any flower show. Messrs. Todd and Co. were awarded a prize of £20 for this artistic triumph.

Non-competitive exhibits were numerous, and added much to the attraction of the show. Gold medals were awarded to Messrs. Sutton and Sons, Reading, for a capital display of Potatoes, Carrots, &c. Amongst the sixty-five dishes of the former were excellent examples of Discovery (the noted new variety), Ideal, May Queen, Reliance, Sutton's Seedling, Ninetyfold, and Ringleader. The stand was tastefully decorated with Cyclamens, Ferns, &c. A like award was made in favour of Mr. G. Bunyard, Maidstone, for a charming collection of Apples. Silver medals were awarded to Mr. W. J. Godfrey, Exmouth Nurseries, for a collection of Chrysanthemums, including many of this season's novelties. The following received a first class certificate: Indian Chief, a rich red decorative variety, and Scarlet Prince, also a decorative of much value. To Messrs. W. Wells and Co., Earlswood Nurseries, Reigate, for an attractive exhibit of new Chrysanthemums and the best of older sorts.

First class certificates were awarded to Chrysanthemums Mrs. Bernard Hankey and Dora Stevens, the first named a pleasing incurved variety, and the latter terra-cotta red, a full-sized bloom. Messrs. R. B. Laird and Son, Pinkhill Nurseries, had a like award for an artistic group of stove and greenhouse plants.—EXPERT.

### Leamington, Warwick, and District.

This annual fixture was held in the Winter Hall, Warwick, on the 19th and 20th, and although the exhibits were not so numerous as usual, they were in several instances of exceptional merit. The groups of miscellaneous plants (Chrysanthemums excluded) were undoubtedly the great feature of the show, and were described by a prominent judge as the best he had seen this year out of London, although he had recently visited fifteen shows. The five guineas offered by C. A. Smith-Ryland, Esq., for the best 24 Japanese blooms, in distinct varieties, was well won by Mr. Blakeway, gr. to Sir Albert Muntz, M.P., Rugby, with a remarkable stand of deep, fresh, well-coloured flowers. The Leamington Nurserymen and Florists' Company (manager, Mr. Harper), were 2nd; and Mr. Liney, gr. to W. Low, Esq., Wellesbourne, Warwick, 3rd. A silver cup, value three guineas, given by the Mayor of Leamington, was won by Mr. R. Jones, gr. to C. A. Smith-Ryland, Esq. Twelve Japanese and 12 incurved, distinct, were required, and Mr. Jones's best blooms were Japs. The same exhibitor was also 1st for 12 incurved and for a like number of Japanese. Mr. Blakeway won for 6 Japs. The special prize (a erect stand) was won by Mr. A. J. Friend, gr. to the Misses Robinson. Baskets of flowers, bouquets, wreaths, and crosses were shown in very fine condition, the principal prizewinners being Messrs. Kimberley (Kenilworth) and the Leamington Nursery Company.

The best group of Chrysanthemums was staged by the Leamington Nursery Company, Mr. W. Vause being 2nd. The same two exhibitors secured the prizes offered for a miscellaneous group, and their positions were unchanged.

Mr. Crump staged a fine collection of fruit, not for competition; the Ranelagh Company had their new Asparagus myriocladus; Messrs. Finch and Co. a grand wreath. The above non-competitive exhibits received suitable recognition. Both the Ranelagh Company and the Leamington Nursery Company won 1st prizes for dinner-table decorations.

### Manchester, Nov. 19th, 20th, and 21st.

Amongst those showing honorary exhibits here were Messrs. W. Clibran and Sons, Altrincham (Chrysanthemums, Celosias, and Cyclamens), gold medal. Messrs. J. Waterer and Sons, Ltd., Bagshot, with Conifers, gold medal. Messrs. Dickson, Brown, and Tait, Manchester, received a similar award for a

superb collection of Gourds and Pumpkins. Mr. G. Boyes, Leicester, had a silver medal for a splendid table of Carnations. A similar award went to Mr. J. Robson, Altrincham, for grand Carnations. Messrs. Wells, Ltd., had a bank of single incurved and Japanese Chrysanthemums. Mr. Edwards had also a nice assortment of table decorations. The prizewinners in the competitive classes were Messrs. C. J. Salter, Reigate; Chandler, Coton House, Rugby; Nisbet, Byrkley; Hall, Melchet Court; S. Vickers, Kenwood, Bowdon; T. Derbyshire, Wilmslow; and others.

### Bolton (Lancashire), Nov. 20th and 21st.

The seventeenth annual exhibition, held in the Albert Hall, had a magnificent opening on the above dates, by the Mayor and Deputy Mayor of Bolton. The exhibits were more numerous and the competition keener than at any previous exhibition. The judges were Messrs. P. Blair, Trenham, J. P. Leadbetter, Hull, J. Hathaway, Southport, and H. Ranger, Liverpool. Mr. B. Ashton (gr. to the Earl of Lathom) staged 18 dishes of Potatoes (not for competition), which were very fine, and attracted great attention. The chief prizewinners were as follows, viz.:—The Open Cup class for 24 cut blooms was keenly fought, there being seven entries. 1. E. Ellis, Esq., Heswall (gr., J. Davies); 2. Dowager Lady Ashburton, Romsey (gr., G. Hall); 3. John Stanning, J.P., Leyland (gr., J. Kirkman).

For 24 Japs Mr. Ellis again came 1st; 2. Ed. Evans, Esq., Bromboro' (gr., C. Jones); 3. Captain Fielden, Blackburn (gr., H. Boyd). The groups were exceptionally good. For a miscellaneous group (12ft square), Ed. T. Crook, Esq., led; 2nd, J. W. Makant, Esq. For the Chrysanthemum group J. Harwood, Esq., won the silver challenge cup outright (gr., W. Burgess), Mrs. Tillotson came 2nd (gr., J. Horrocks); and for the mirror groups the order was J. Musgrave, Esq. (gr., J. Abbott), T. Walker, Esq. (gr., J. Barelay), Mrs. Ainsworth (gr., J. Trevena), and the Mayor of Bolton (gr., G. Pawson), as named. The President's Cup for 24 cut blooms was again carried off by Ed. T. Crook, Esq., J. W. Makant, Esq., coming 2nd.

The fruit classes were specially good. For 2 bunches Black Alicante 1st and gold medal was won by I. C. Waterhouse, Esq., Prestbury (gr., A. Hall). For 2 bunches black (any other variety), Colonel R. I. Blackburn, Hale, led, and J. Musgrave followed. For 2 bunches white Grapes Colonel R. I. Blackburn again was 1st. For 6 large-flowering Chrysanthemum plants 1st and silver challenge cup went to J. Musgrave, Esq. Vegetables: E. Knowles, Esq., (gr., G. Corbett) won R.H.S. bronze medal and 1st; P. S. Mayhew, Esq., Chorley (gr., H. Parkinson, 2nd; and R. W. Harley, Brampton Bryan, 3rd. The Primulas were specially commented on by the judges, there being some real good competition. For 6 dinner table plants there were 10 entries, Mrs. Tillotson leading, and Mr. Thos. Walker being second. For 3 plants of Gloire de Lorraine there was a fine show, and Ed. T. Crook, Esq., won. The vases were well represented, especially the singles. The gardener's local classes were also well competed for. The amateurs drew great credit on themselves, showing what can be done within a radius of eight miles of a smoky town like Bolton. This year a handsome silver challenge cup had been presented to the society for a group of Chrysanthemum plants. This, along with a gold medal, was won by Mr. W. Laidlaw, Chorley Old Road; 2. Mr. H. Windle, Deane; 3. Mr. W. Eckersley, Middle-Hulton. In the other classes the competition was also very keen. Considering the inclement weather the attendance was very good, and on the Saturday morning the doors were thrown open to admit free the children of the whole of the institutions of the town and district; also the poor children of Bolton who could not afford to pay.

### Chester Paxton—Annual Show.

The annual exhibition of the Chester Paxton Society was held in the Assembly Room of the Town Hall on Wednesday and Thursday. The exhibits showed a decided improvement on previous years, and in the opinion of the adjudicators the quality of the Chrysanthemums was of a very high order. The groups of Chrysanthemums formed a special feature. Mr. T. Gibbons Frost, Mollington Banastre (gardener, Mr. Gilbert), won for a large group. The credit of the position was enhanced by the fact that the exhibitor had beaten Major Macgillycuddy (per Mr. Stubbs), who for the first time had to take second place. Third, Mr. Edward Dixon, Littleton Hall (per Mr. John Dutton). The first prize of six plants of single Chrysanthemums was easily carried off by Major Macgillycuddy (per Mr. Stubbs); Dr. Lawrence second. For six plants of the Japanese incurved varieties there were only three entries, Major Macgillycuddy again taking an easy first, Mr. Gibbons Frost being second. The exhibits of Chrysanthemum cut blooms were numerically in excess of previous years. The principal prize was for eighteen Japs, and was carried off by Mr. Charles Threlfall, of Tilstone Lodge (per Mr. T. Herbert), the first prize for six vases of single varieties being captured by Major Macgillycuddy. A new feature of this year's exhibition was a class for three ladies' sprays of sweet-scented Violets. The first award went to Sir

George Mayrick, Bart., of Bodorgan (per Mr. W. Pilgrim). Mrs. J. C. Okell was second, and Miss Humberston (per Mr. Wakefield) third, the three exhibits being very beautifully arranged. Bottled fruits, which are always an important feature at this exhibition, were fairly well represented by excellent examples. The chief prize for the twelve bottles was carried off by Mr. Owen Roberts (gardener at Willington Hall), who was very closely followed by Mr. John Weaver. A most notable and perhaps the most praiseworthy of the honorary exhibits was a collection sent by his Grace the Duke of Westminster (per Mr. N. F. Barnes), to whom the judges unanimously awarded a gold medal. Owing to the increased number of entries Messrs. Dicksons, Ltd., had to be content with a smaller space than usual, but the display was a very effective one, and was in every way worthy of the great firm. Messrs. McHattie and Co. also sent an interesting exhibit of flowering and foliage plants, locally grown Apples, &c., and the well-known firm of Messrs. Clibrans, of Altrincham, had a beautiful display of Celcias and Chrysanthemums.

### Cardiff Gardeners' Association.

The third meeting of session took place at the Grand Hotel on Tuesday, November 10, Mr. W. J. Prosser presiding. Mr. H. R. Farmer, gardener, Cardiff Castle, gave a lecture on "Vines." As far as time would allow for a subject of this kind, he gave as many details as was possible, and much useful information, especially to beginners, deeply impressing upon them to be careful in the management from the period of striking the eyes to the cutting of the fruit. Several of the leading varieties were mentioned, and hints given as best for their individual management. At the close the best thanks of the Association were accorded the lecturer, who was fortunate enough last July to have received from the deputation of the R.H.S. to Cardiff a Knightian Medal for his pot Vines, which, at the time, were carrying well-finished bunches of Grapes. A vote of thanks was also accorded to Mr. Davy for staging *Catasetum viride flavum*.

### Newport (Mon.) Gardeners' Improvement.

The usual meeting of the above society was held on November 11, when Mr. J. Pegler, hon. sec. of the association, read a paper on "The Wonders and Curiosities of the Vegetable Kingdom" to a large attendance of the members, presided over by Mr. J. Duff. Mr. Pegler, in his paper, gave a description of a Brazilian forest, also a Mangrove forest; he gave the height of the Wellingtonia, and circumference of the trunks of these trees, and proceeded to describe the Banyan, Baobab, Bread Fruit, and Traveller's Tree. The Victoria Lily was given as having the largest leaf, and Rafflesia Arnoldi as the largest flower. The Lace plant, the Dove plant, Clock plant, Venus' Fly-trap, and the Sundew were also dealt with. The paper was listened to with great attention, and a discussion followed, in which the chairman, Messrs. Powell, Harris, Woodward, Jones, Basham, Jarvis, Bishop, Daniels, and others took part. A hearty vote of thanks was accorded Mr. Pegler for his paper.

### Shirley (Southampton) Gardeners'.

The monthly meeting of this association was held in the Parish Room, Shirley, on Monday, November 16, and there was a very large attendance. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, lectured on the cultivation and exhibition of the Chrysanthemum. The address was a most interesting one, and was listened to with great attention. The lecturer promised to have the details typed, and forwarded to the secretary for distribution amongst the members. As he had to leave to catch a train, he could not stop for the usual discussion which takes place after such lectures. Before leaving he was very cordially thanked for his interesting address. The chairman then distributed the certificates awarded at the last meeting for exhibits. Mr. Valentine won the society's certificate for the best Chrysanthemum bloom. Mr. Bushell gained a like honour for a specimen Orchid. The next lecture will be given by J. Brierley, Esq., F.C.S., Member of the Society of Public Analysts, on "Beginnings of Life."—J. M.

### Young Gardeners' Domain.

The Editor welcomes short letters from under-gardeners. Letters should be confined to 500 words in length, should be written only on one side of the paper, as clearly as possible, with one inch space at both top and bottom, as well as at the sides.

#### Principles of Propriety.

When starting for the first time in a situation, journeymen and apprentices work with honest determination to get on; but gradually this wears off. They lose interest in their work. I can safely say that nine-tenths of the young men in England spend too much time and money in public-houses and on

pleasure-seeking. There is no serious thought or study in order to become proficient in gardening. They forget that they are dealing with the vegetable creation, which abounds with mysteries yet to be unfolded. How ought gardeners to conduct themselves? Let them keep out of public-houses as much as possible. I am not an advocate of teetotalism. Let the motto be: "Use, but do not abuse." Let all of us also be very careful with our language: there is nothing more detestable on a gentleman's establishment than coarse, slovenly speech. The next thing to be detested is smoking during working hours. If one must needs smoke between meals, let him get out of sight in the shrubs for a few minutes, and have his "fifteen draws." Personally, I prefer a snap of bread and cheese about eleven o'clock, to a smoke, and I enjoy a good smoke after dinner. Above all, be punctual every morning, and bear in mind that the longer you remain on the place during the day, the more you learn. If you make a practice of coming late every morning (five minutes, and half an hour sometimes) and you are not called to account for it, and think yourself clever and a favourite with the "boss," you will find your great mistake one day. The wise head of the "boss" shakes gently, and he says to himself, "He'll make a poor gardener." If you stay any time in that garden, then you will find yourself assigned the work of a labourer, unless you fire up a bit better.

Now a word may be said with regard to study. All of us know we cannot well study without the proper books, and that means money. Young men and apprentices have not much money to afford to buy the best books, not even any, sometimes. Without doubt most head gardeners have a few books on the elementary principles of botany, and I should advise young men to approach the head with due respect, and inform him of the desire to learn, and ask him to lend some books to begin with. If there is anything in him at all, he will give you them, and do all in his power to help you; that is, if you deserve it. Again, if you happen to be in town any day or night, keep your eyes open. One day I strolled down Leith Walk, Edinburgh, and espied a second-hand book shop. I entered, and rummaged for two hours or so, and tumbled on "Keith's Botanical Lexicon," which I obtained for 7d.—a good book, and certainly not out of date. Anyone who is anxious about his becoming proficient in the profession can easily find ways and means to obtain material for study. If he cannot buy, there are free libraries and weekly garden papers.

The object in my contribution is to bring before young men some hints on the way to conduct themselves, and gain respect for the most ancient of callings, and also to endeavour to excel in such things as appertain to gardening. The struggle to gain the top may be hard, but those who have the hardest struggle have the most experience practically. In closing, allow me to say that I am now in my fourth general foreman's place, and I hope my experience is a warrant for attempting what I have written. I hope in the course of a few weeks to write an article on "Foremen, their Conduct and Examples to Those Under Them." Trusting I am not trespassing on space in your excellent paper.—SCOT. [The letter will be acceptable.—ED.]

[Other letters are unavoidably held over.—ED.]

## Entomology.

### *Tortrix Wæberiana*, or *Waberian Moth*,

Among insects that are harmful to the Peach and Apricot trees, is this species, a figure of which is here given. Its presence in the larva state is indicated by small heaps of dust upon the bark. When this is

TORTRIX WÆBERIANA, OR WABERIAN MOTH.

removed a furrow is perceptible, in which the larva feeds and occasions a flow of sap, the consequence being that the tree is much weakened where the insects are numerous. This small but pernicious caterpillar feeds throughout the year. It is dull green, and red-headed. The moth, which is brown, with silvery and golden marks, sits upon the bark in May and June, and while the wings are folded, the human eye can hardly distinguish it.

*Pennisetum macrophyllum atrosanguineum*, the new Grass, for which H. A. Dreer received honourable mention at the late exhibition in Boston, is of a dark bronzy red, a rare colour in Grasses.

**SAD END OF A NURSERY EMPLOYEE.**—A workman at Messrs. Barr and Sons' nurseries, Long Ditton, on Tuesday last, found the body of Clemmes Sountag, a foreman, lying in a water-lily tank, with a fearful wound in the throat. A table-knife was found at the bottom of the tank.

## Hardy Fruit Garden.

**PREPARATION OF GROUND FOR PLANTING BUSH FRUITS.**—Generous treatment in regard to deep digging of the ground, and a liberal application of manure, thoroughly incorporated with the soil, results in providing a suitable medium for healthy, vigorous, and fruitful growth. Ground, whatever its character, may be trenched, but whether this should be ordinary trenching or bastard trenching will depend chiefly on the treatment the ground has hitherto received. Trenching is best carried out on ground which has at some previous period, not just recently, been deeply dug or bastard trenched. The subsoil will, in this case, have become ameliorated and in a fit state for bringing to the surface. Mix with it decayed manure. The other form of trenching, namely, bastard trenching, should be adopted when no previous deep moving of the ground has been attempted. The soil is moved to the depth of two spits, but these must not be reversed in position, or the inert material, which is usually found in subsoil that has not been cultivated, will be brought to the surface, and the best buried. Mix good, decomposed manure with both spits, the lower spit, if consisting of very unkind material, being intermixed with any other soil or vegetable matter of an improving character.

**BUSH GOOSEBERRIES.**—Among the best varieties of Gooseberries to plant for general purposes are *Whinham's Industry*, *Keepsake*, *Crown Bob*, *Whitesmith*, *Red Champagne*, *Yellow Champagne*, *Warrington* and *Ironmonger*. To grow as bushes on good soil, plant at a distance of 6ft from each other. This will give them ample room to develop to a prolific size to give good crops. Fair sized, symmetrical young bushes should be planted, possessing good, fibrous roots, which spread out to their full extent, and cover carefully with some fine soil. Cover the roots with a little mulching consisting of some light, half-decayed, strawy material.

**BUSH RED AND WHITE CURRANTS.**—A plantation may be wholly formed of these, or they may alternate with Gooseberries, the same distance apart in planting being followed. *Red Dutch*, *White Dutch*, *Raby Castle*, and *Fay's Prolific* are the best varieties. The two latter are red varieties. For forming bushes, young plants must be procured with several stout stems, which may be cut back and others formed, that is, two from each may be originated to constitute the foundation of the bushes. Seven main stems will be sufficient to form a good bush. Spurs for the fruit bearing must be built up by summer pruning the side shoots, and shortening the leaders in winter, also spurring in the side shoots at the latter time.

**BLACK CURRANTS.**—These are wholly grown in bush form, the best varieties being *Black Champion* and *Lee's Prolific*. The open bush form of growth is favoured, and is altogether the most prolific. Restricted and stunted training is by no means prolific for these fruits, hence the bushes should be planted with a view to maintaining a good supply of wood, which must not be crowded. In a word, retain all the best of the current year's wood, give it plenty of room, and cut out the old. The distance apart for planting should be six feet every way. Black Currants do well in moist soil and positions.

**CORDON GOOSEBERRIES AND CURRANTS.**—Grown against walls and trellises, the trees do not occupy much space, and are very prolific if carefully managed. Trees trained for walls may be obtained from the chief hardy fruit nurserymen, the branches being originated about six inches apart from an horizontal base. There is, however, no difficulty in obtaining them as single stem plants, the cultivator training them himself; but time is saved by commencing with plants having stems already originated, but not, of course, fully developed. To form single or double cordons for walls or fences, cut back a single stemmed plant to twelve inches. For a single cordon train one shoot upright; for a double cordon train two, these being trained six to nine inches apart. Pinch the side shoots in summer, and shorten the leaders in winter to nine inches. This must be repeated annually until the branches have attained the height required. Cordon culture is excellent for procuring late crops, utilising north and east walls for this purpose.

**RASPBERRIES.**—Ground prepared as for Gooseberries and Currants will suit Raspberries. Good varieties consist of *Superlative*, *Baumforth's Seedling*, *Carter's Prolific*, *Prince of Wales*, and *Norwich Wonder*. Raspberries may be planted in lines or clumps. With the former method, the canes will require training to wires, which must be stretched between stout stakes or posts fixed at each end. Three lengths of wire will suffice, the upper length being not more than 5ft high. Plant the canes

two feet apart. With the clump system three canes may be planted a foot apart in a triangle, eventually driving down a stout stake not more than 5ft high in the centre. The best planting canes are those of slender growth, but possessing ample fibrous roots. All must eventually be cut down close to the ground the first season, so as to encourage the formation of strong fruiting canes.—EAST KENT.

### Fruit Forcing.

**CUCUMBERS.**—Winter-fruiting Cucumbers are frequent failures. This is mostly due to a deficiency of heating surface combined with an arid atmosphere. Sharp weather necessitates brisk firing, which, when there is little piping, dries the atmosphere, causing excessive evaporation from the foliage, and it becomes crippled in consequence; the fruits are also stunted, and swell indifferently, and where the pipes are in close proximity to the roots the soil is dried too much, and the growth consequently is not healthy. Heat radiated at a high temperature is not good for vegetation, and when the water in the pipes has to be kept at near boiling point failure is almost inevitable; besides, it is highly wasteful of fuel. Admit air very carefully, yet afford a little when opportunity offers, excluding it, however, when the external air is cold and sharp, turning off the top heat when the sun is very bright and likely to raise the temperature much over 85deg or 90deg. In bright weather damp the house morning and afternoon, closing early; but be careful not to wet the embryo fruit, for water hanging from it will cause decay. Water will be needed at the roots about twice a week, always affording it equal in temperature to that of the bed. Maintain a night temperature of 60deg to 65deg, and 70deg to 75deg by day, and advancing 5deg, 10deg, or 15deg from sun heat, and endeavour to enclose as much sun heat as is safe.

The plants from the early August sowing and planted out in September have covered the trellis and are fruiting, but this must be allowed very moderately if the plants are expected to afford full supplies at a later period, and unless there is undue vigour in the plants they should not be allowed to bear for a few weeks, especially if they are wanted to afford fruit at the new year and forward. Attend frequently to stopping and thinning, also tying the shoots, avoiding overcrowding, as stout foliage better endures the trying ordeal of wintry weather. Canker is best held in check by lessened moisture, and not any at the collar, rubbing quicklime well into the affected parts. Removing useless old leaves is good for the plants, and may keep off attacks of red spider, but if that pest appears, sponge the infested leaves carefully with a solution of paraffin and softsoap, 2oz to a gallon of tepid water. If this be done on the first appearance of the pest much after trouble will be saved. Mildew must be kept under by dusting the infested parts with flowers of sulphur, or brushing the pipes with sulphur brought to the consistency of cream with skim milk. This will also destroy white fly. Aphides succumb to vaporisations with nicotine, as also does mealy bug. Tobacco fumigation in two or three consecutive evenings is also effectual against aphides and thrips.

**CHERRY HOUSE.**—The trees must now be pruned. Full-grown trees, properly attended to in stopping during growth, will require very little pruning now. Any summer shoots that have grown considerably should be cut back to about an inch of their base, and the worn-out spurs may be shortened or removed as required. Cut out dead spurs and thin those that are crowded, always reserving sufficient for producing a crop. The terminal shoots in the case of trees extending must not be shortened, but when they reach the extremity of the trellis they will need shortening, always to a wood bud. Young trees will require to be cut back as much as may be necessary, the central shoots being shortened so as to originate others for filling the space regularly; but it is not desirable to start them too closely together, as they may cause the branches to press against each other, and this commonly results in gumming. Fan training is unquestionably the best for the Cherry, as it admits of replacing any branch falling a prey to this disease, and of renewing worn-out limbs.

Thoroughly cleanse the house—the woodwork with soapy water, using carbolic or paraffin soap, and well brushing off the dirt, afterwards cleansing with clean water, and washing glass clean outside as well as inside with clean water. Limewash the walls, using freshly-burned lime with a handful of flowers of sulphur to each pailful of whitewash. Syringe the trees with hot water, 140deg to 150deg, to subdue any hibernating pests, and if infested with red spider dress with a solution of caustic soda and pearlash in equal parts, using 1½oz of the mixture to a gallon of water, and applying by means of a clean, half-worn painter's sash brush, so as to wet every part evenly, especially the cracks and crevices of the bark, taking care not to injure the buds. Remove the loose surface soil and supply fresh loam, with a pan of well-rotted manure intermixed, sprinkling on the surface a good handful per square yard of some approved fertiliser, scratching in very lightly with a fork.

The roof lights being off, they need not be replaced until the time arrives for starting the trees, which should be about the middle of December to have Cherries ripe early in May. The very early varieties will ripen sooner, such as Belle d'Orleans and Rivers' Early, these being followed by Governor Wood and Black Tartarian. Cherries must not be brought forward too rapidly, especially when forcing them for the first time. Trees under fixed roofs should be well supplied with water to keep the soil moist; but fixed roofs are great mistakes in the early forcing of Cherries, unless they are grown in pots, when they will be placed outdoors after the fruit has been gathered and wood sufficiently developed. Trees in pots are readily forced, and afford excellent fruit at the end of April or early in May, when fresh ripe fruit is not over plentiful. Cherries are then always appreciated at table.—ST. ALBANS.

\*\* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

### VINES FOR PLANTING AND FRUITING (G. C. S.).—

1. The Vines, two years old from the eyes for planting, should be shortened to the length required, say the bottom wire of the trellis. This is better than leaving full length and disbudding after planting and growth taking place, as the forces of the Vine will be concentrated on the uppermost buds, and the growths not required, or below the pruned buds, can be removed whilst they are relatively small, thus confining the vigour to the shorter shoots retained. 2. The Vines in pots and to be fruited therein may be shifted into others a size larger, but it is not advisable to give them a large shift, a couple or at most 3in larger size, potting firmly, and providing good drainage. With feeding they may be fruited well in the 12in pots, and they would certainly derive considerable benefit by knocking out the bottom or enlarging the apertures of the pot, and partially plunging in the border, always providing free access for the passage of water passing through the pots. 3. There will not be room for fruiting the Vines in pots between the permanent, these being only planted 3ft apart. This distance is much too small for permanent Vines; they should be at least 4½ft apart, then between them you may fruit the supernumeraries.

### PROPAGATING POTATOES FROM CUTTINGS OR SHOOTS (An Old Contributor).—

There are several methods. 1. Raising from single eyes. In this case the tuber is cut into as many portions as eyes, and each is potted into a small pot and placed in a house with a gentle heat, say 55deg to 65deg, with 10deg to 15deg or more rise from sun heat. Each eye soon pushes a growth, which, when it has grown a few inches high, is topped, and the top inserted just as one would insert a Pelargonium cutting, and in a gentle heat and shade from bright sun the cutting soon roots. Other shoots shortly appear from the cut down plant, and when these are long enough they can be taken off and inserted as cuttings, suffice that each cutting has two joints and the growing point. The plants first struck as cuttings can be topped and each top inserted, so that, by commencing about the middle of February, a great number of cutting plants can be had from a single tuber, as well as the single eye plants. 2. A tuber is placed to sprout in a house or place where there is heat and moisture, and when each sprout is about 3in long it is detached and treated as a cutting, and the same eye of the tuber which gave the first cutting or sprout usually develops several such cuttings from side eyes, and these can be taken off as advanced and potted. 3. Placing the tuber or tubers in a box containing soil, say some under and over, just covering, putting in a warm house, and as the shoots appear above ground taking off the cuttings and rooting them. In this way about a hundred plants have been raised from a single tuber. It is scarcely necessary to point out that if such compound multiplication is contemplated, it is important to commence not later than March, because the rooted cuttings should be nice little plants in pots, duly hardened off, so as to be planted out in May. Even when the division is not carried beyond the single eye system it is advisable to establish them in pots, as they succeed much better

than when the single eyes are put directly into the ground. This can readily be effected in a cold frame, protection being given on frosty nights. The cuttings, on the other hand, must have heat for striking, as well as the tubers or plants for growing, and the young stock must be properly hardened off before planting out.

**HYDRANGEA LEAVES FOR OPINION (D. C.).**—There is nothing the matter with the leaves; at least, we could not discover anything. They are simply become sere or mature, and is quite natural.

**OFFICIAL CATALOGUE OF THE N.C.S. OF FRANCE** (Constant Reader).—Could you tell me where I could get the Official Catalogue of the French National Chrysanthemum Society (diseases and pests)?

[We are sorry to have delayed an answer to your question. It is published in the form of a chart, and can be had from Mons. Philippe Rivoire, Secretary French National Chrysanthemum Society, Lyons, France.]

**R.H.S. EXAMINATION (Certificate).**—You will obtain information as to what books the Council of the R.H.S. recommend by applying to the secretary of the Society, 117, Victoria Street, Westminster, S.W. You should watch the front page of the *Journal of Horticulture* for announcements by tutors who prepare men like yourself by correspondence tuition. We advise you to pay 1s. for a set of the questions that have been given at past examinations, and to study these. You will thus become acquainted with what is likely to be required of you, and can set yourself questions to answer. If you cannot answer those put by the R.H.S., look up books and papers bearing on the several subjects. You will never regret having tried, and we hope you will sit for examination next year, if for no more than the experience of it. We think that the writing practice offered by us under the Young Gardeners' Domain would be of great assistance in preparing you for the clear and ready expression of your knowledge of practical horticulture. Are there no elementary botany classes in your town? We have known young men walk five and six miles to attend classes.

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (T. and P.).—Pear Magnate. (T. S. P.).—1, Rambour Franc; 2, Reinette Grise. (M. Abbs).—Not known, probably a local variety; it is somewhat like Betty Geeson.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (Sussex).—Your flower is a cultivated form of *Lathyrus setifolius*, L. (J. P.).—1, *Oncidium Forbesi*; 2, *Cypripedium venustum*. (F. L.).—*Aucuba japonica vera*. (N. F.).—See note under Answers to Correspondents. (F. L., Dover).—1, *Cupressus Nootkatensis*; 2, *C. macrocarpa lutea*; 3, *C. Lawsoniana pendula*; 4, *Cedrus atlantica glauca*. (L. B. W.).—1, *Abies Pinsapo*.

## Weather Notes.

### At Hamilton.

The elements still give much anxiety to tillers of the soil. Here and there throughout the country some belated corn stooks are standing. Wheat sowing in many cases has been practically impossible, and at present the weather is very stormy and boisterous.—D. C., November 23.

### Meteorological Observations at Chiswick.

**Motor versus Horse.**

It has been abundantly apparent for some time that the usefulness of the motor could not be limited to road traction, and the chief objections to the swift motor on the public highways are of no account as regards work in the fields. Highways are public property, the fields are private, and the farmer is at liberty to use any form of power he thinks the cheapest and most applicable to his business.

Well, the agricultural difficulty has for the last twenty years lain in the well nigh impossibility of applying steam power to farm work. The steam engine has been too bulky for active work on the land—i.e., for any work such as is done by horse power; but the advent of the petrol motor has altered all that, and it would certainly appear possible for all the work of a large farm to be performed by the aid of petrol. This certainly seems to be a big order, but no one who lives near a great trunk road would doubt that the farmer could go round his farm on a petrol-driven motor cycle or tricycle, and, as a fact, ordinary cycles are now largely used by farmers. The advance in petrol motorage has been so great, that the power which was quite lately only applicable to personal conveyance is now usefully employed for field work.

In our opinion, the only question has been that of cheap traction, and if that has been solved the day of the farm horse is gone. That the motor on wheels can compete with the horse on metalled roads cannot be denied, but so far few farmers would acknowledge that it is possible to produce an engine which can proceed up and down a field in the same manner as a team of horses, and at the same time draw a plough, drag a set of harrows, doing good work at a low price.

Yet such is the fact. Recent trials in Bedfordshire have most conclusively proved that the motor can do any work as well as and more cheaply than the horse.

The trials proved that land could be ploughed 7in deep for 7s. 8d. per acre, a crop of Wheat could be cut for 1s. 7d., and a crop of grass for 1s. 9d. per acre, whilst straw could be chaffed at about 2s. 6d. per ton. Now, we know very well that land can be ploughed by steam at 8s. per acre, and to a good depth, but when the cost of coals and the leading of water are considered the work of the motor must be far the cheapest.

We have discussed the question of motor traction with many practical farmers, and it is natural that every man who is fond of a horse should be averse to dispensing with its services and adopting an alternative without good reason. Therefore we meet with most abundant criticism, but the objections may be roughly summarised under two heads—viz., “expensive outlay on plant” and “the doubt whether motors will work on very soft or sticky soil.” For instance, many farmers who would believe in a motor dragging a plough on a piece of seeds or stubble, have no faith in its practicable working on recently mowed soil. There is also a strong belief that the wheels of a heavy motor will have a serious effect in “saddening” the soil. As the Ivel motor, which we have in mind, only weighs 28cwt, each of its three broad wheels carries less than half a ton, and we should very much doubt that the passage of these three

wheels, over even very soft land, would do as much damage as an average pair of draught horses, while they would in all probability do at least twice, or even three and four times the work. We notice that the makers of these engines conducted their ploughing experiments on what they describe as “very hard ground.” The wheels of the motor would therefore get ample purchase, but we think that some good proof is required that they will travel as well on a soft surface. We have had much practical experience of the working of rotary Potato-diggers, and know well how their driving-wheels skid in very loose mould, and we fear that under some conditions these motors will make but very slow progress at their work.

As regards the outlay, no doubt there are many farmers who could not afford to lay down £300 on what is as yet only in the experimental stage. If a farmer were to sell his horses and buy a motor with the money, he would require at least ten average farm horses to realise the necessary amount, and the prime cost will be a great bar to their soon coming into general use. They will be introduced first on large farms, and by land-owners on farms in hand, in fact, several noblemen have already tested and speak highly of them. They will at first be used only partially to supplant the horse, but the work they will do now gives such great promise of what they can by improvement be made to do that, although they may not entirely take the place of horses, we are confident that they will do so to a very considerable extent.

In one experiment with a 3-furrow plough, 11½ acres were ploughed in 17½ hours by the use of 25½ gallons of petrol, each acre being completed in 1½ hours, with very little more than 2 gallons of petrol. Then the motor only eats when it is at work, while the horse requires feeding whether there is work to do or not. Horses cannot be kept without incurring loss from disease and accident, as well as veterinary bills. Motors require repairs and renewals, and are also liable to accident; but the cost of these items may be calculated with certainty, which cannot be done in the keeping of horses.

Every year the difficulty of obtaining horsemen is an increasing one; waggoners keep asking higher wages, and are less inclined to work. This independent spirit on their part must have considerable effect on farmers who may think of trying motor power. Labourers will be needed as much as ever to do hand work, but lads of fifteen years to twenty years will largely be dispensed with.

**Work on the Home Farm.**

After a promise of better things the weather has reverted to its old ways, but adding thereto a touch of snow. Perhaps there is yet worse to come, for we have to-day seen what is to us a record flock of golden plover—about 300 or so. Does such a congregation denote the approach of severe weather? Only on the lightest land is horse work possible, and autumn Wheat sowing is being given up in despair in many quarters.

Martinmas week is to many farmers a period of enforced inactivity, the farm servants having left and new ones not arrived, the farms are very short-handed. Mangolds are being pulled and stored, but the carting is very heavy work, and the carts are but partially filled. As we have observed before, the roots are undersized and the crop below the average in weight. Fortunately the weather, which has been too cold and wet for Mangolds, has suited Swedes, and they are now very good. We never saw them of such soundness and quality. When they are a little riper a good lot must be pried to help out the Mangolds in the spring.

We got some manure carted out to the seeds, but it was very laborious work. The manure is wet and heavy, and even the seed land is too soft to take heavy loads on. We should like to get the remainder on at once, as there is hope that we shall soon see the steam ploughs here to break up the swarth, in readiness for next year's Potatoes. These ploughs are now making very long days and doing most valuable work. They can go where horses would stick fast or do more harm than good. Rams and ewes must be parted now if they are still together. The rams are best put with the feeding sheep, i.e., the wether sheep, as it does not pay to keep them badly and let them get into poor condition.

The November slump in the beef trade is over and prices are firmer again, the top quotation being 7½d. per lb. This is promising for the Christmas beef feeders. On enquiry we find that not so many cattle as usual are being prepared for Christmas. Store cattle are rather depressed. Threshing has not provided much spare money to buy stores with, and bank balances are low. Small and lean sheep are in the same fix, there being few buyers just now, notwithstanding the abundance of food. Milk cows are as dear as ever, which should remind us that no opportunity should be lost of starting heifers breeding. Now is the time.

## PLANTING SEASON

## PAULS' ROYAL NURSERIES

WALTHAM CROSS, HERTS.

12 miles from Loudon. South Entrance four minutes' walk from Waltham Cross Station; West Entrance three minutes' walk from Theobald's Grove; both Stations on the Great Eastern Railway.

## SPECIALITIES:

**ROSES** in all forms, from open ground and in pots. Gold Medals in 1903 from Royal Horticultural and Royal Botanic Societies.

**FRUIT TREES** for the Orchard, Garden, and Forcing House. Hogg Memorial Medal, 1901.

**HARDY TREES** for Streets, Parks, and General Planting. Silver Medal from Royal Agricultural Society of England.

**SHRUBS**, both Evergreen and Deciduous.

**CLIMBING PLANTS**, Hardy and Greenhouse.

**RHODODENDRONS, CAMELLIAS, & AZALEAS.**

**HERBACEOUS PLANTS** in great variety.

**BULBS and SEEDS**, and all Garden Sundries.

PRICE LISTS ON APPLICATION. INSPECTION INVITED. Upwards of 1000 Medals, Prizes, and other Awards at leading Exhibitions during the past 42 years.

SOLE POSTAL ADDRESS—

THURSDAY, DECEMBER 3, 1903.

## Plants with Possibilities.

HERE are some plants which seem to possess wonderful fascinations for cultivators, and king of them all perhaps, at the present day, is the Chrysanthemum. At the moment of writing the show season is at its height, and thousands of enthusiastic adherents are doing homage at the shrine of the Autumn Queen. As is usual at this season, both the pessimist and the critic are on the war path. The latter is preaching his annual crusade against big blooms, and telling us how the beauty of the flower is lost through the efforts of cultivators to produce the flowers that grace the exhibition boards. There is doubtless a good deal of truth in what the critic says, but the story has been told so often that we have got used to it, and it seems not to have the slightest effect or lessened the production of big Chrysanthemums.

The wail of the pessimist is the same as we heard last year and the year before. It predicts a decline in the public taste for large blooms, and foretells the downfall of Chrysanthemum shows. Perhaps at some future date the prediction will come true; but judging from the general interest again displayed this year, there seems no likelihood of either Chrysanthemum shows or massive blooms becoming things of the past yet awhile. It is said by some that the present interest in show Chrysanthemums is kept alive by the tempting baits that are offered to exhibitors in the shape of challenge cups and substantial prizes; but I am by no means inclined to accept this statement without question.

Growers and others, however, seem to overlook the possibilities of the plant. The Chrysanthemum is a flower possessing wonderful capacities, and herein may be found the secret of its remarkable popularity. In the

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

hands of an expert grower the ever-ready Chrysanthemum ceases to be a natural and becomes an artificial flower—if the term be accepted. In fact, it is just what the grower makes it, and herein the charm consists. Under ordinary cultivation Nature will produce a Rose perfect in form and substance, but Nature unaided will not produce a Chrysanthemum flower of show standard, and when such is obtained the grower knows that the credit belongs very largely to himself and his own skill. While this is so, shows may be abolished and prizes withheld, but large Chrysanthemums will be grown if only to illustrate the prowess of the cultivator. What a Chrysanthemum flower is depends almost entirely on the treatment the plant receives, and ample evidence is afforded of this in the case of certain varieties that are gems when seen on the showboard, but if cultivated on ordinary, commonplace lines, they would hardly be recognised as the same.

Coupled with the possibilities of the plant are its glorious uncertainties. Looking back over the years that are past, one can see the part that the Chrysanthemum has played in British floriculture; but who will be so bold as to say that the plant is played out? The development of cultivation has been wonderful; the varieties raised almost innumerable, and still there is the future. Who knows what it has in store for the plant that has captivated the hearts of all sorts and conditions of cultivators, from the millionaire on the one hand, to the humble artisan or labourer with his home-built greenhouse on the other? And the possibilities of the Chrysanthemum are largely responsible for it all. I will admit the usefulness of the plant, its beauty, its accommodating nature, and all else that can be said for it; but, after all, its present position is due to the fact that it is amenable to cultivation, and readily responds to the skill of the grower.

\* \* \*

It is not a far cry from the conservatory to the kitchen garden where big Onions come in for reproaches at the hands of the critic who can see nothing but ugliness in large vegetables. Yet big Onions continue to be grown year by year. Why is this? For exhibition, some may say, and in a measure this is true, but not entirely, as there are many who take a pride in "big Onion" growing and never show them at all. The fact is, the Onion is in the vegetable garden what the Chrysanthemum is in the floral department, inasmuch that it is a plant which lends itself to cultivation, and possesses wonderful possibilities. I know men who spend time and money every year in trenching and manuring and raising plants, and they seem to begrudge neither the labour nor the expense that is bestowed on the Onion bed, and it is all for the satisfaction of obtaining bulbs that will turn the scale at two pounds weight or more. It would be absurd to say that big Onions are grown primarily for the kitchen, because bulbs one quarter the size and produced at one quarter the cost are more useful in that department; but there is a certain fascination about Onions that is attractive to growers. It is a plant possessing possibilities, and responds readily to liberal treatment; consequently the enthusiastic vegetable grower finds in the Onion something on which he can bestow his cultural skill and see the results. It matters nothing to him whether the giant bulbs are the least useful and profitable; they are unique and out of the common, and in pointing to them he is able to say that Dame Nature would not have produced them without his aid.

\* \* \*

Occasionally I read reports of the shows of one of those unique Lancashire institutions known as Gooseberry Clubs, and am surprised at the weights and dimensions of some of the berries staged. Long before critics began to rail about size, Gooseberry Clubs existed, and competitors adopted the many devices best known amongst the Lancashire Gooseberry growers for the production of giant fruits. This cult is confined practically to the one county, and many of the large berried varieties originated in it. It is generally admitted that large Gooseberries are wanting in flavour compared to smaller varieties, but what does the Lancashire weaver care about that? He grows for size and weight, and Gooseberries to him are what Chrysanthemums and Onions are to other classes of cultivators [?]. In fact, I mention the instance as an illustration of a plant possessing possibilities, and those possibilities being put to the test by enthusiastic cultivators. Thus it happens that certain subjects amongst fruits, flowers, and vegetables stand out conspicuously above their fellows in general popularity. They may have beauty or usefulness to recommend them; but above all they will generally be found to possess possibilities, either in their adaptability to development at the hands of cultivators, or their readiness to respond to the skill of the hybridiser. In

short, to the gardener, possibility is a word with a meaning. In almost everything he does, he sees a vision of what might be, which urges him forward; and what matter if the vision never actually becomes reality? In attempting something great, he invariably does something meritorious.—G. H. H.

## County Council Instruction: Horticulture.

(Continued from page 489.)

ISLE OF MAN.—We have no Horticultural Instructor in connection with this Council.—A. ROBERTSON, Town Clerk, Douglas.

SOMERSET.—The names and addresses of the County instructors in this County are as follows: County Instructor in Agriculture, Mr. J. H. Burton, M.Sc., Spring Villa, Clevedon Road, Weston-super-Mare; County Instructor in Horticulture, Mr. John Ettle, F.R.H.S., Stanley Grove Road, Weston-super-Mare; County Instructor in Poultry Keeping, Mr. C. E. J. Walkey, 2, Malvern View, Stanley Grove Road, Weston-super-Mare.—C. H. BOTHAMLEY.

STAFFORDSHIRE.—There are in this County thirty-one practical gardening classes, at each of which twelve pupils receive instruction. I enclose herewith a copy of the directory of this committee, on page 65 of which all information relating to the classes will be found. Our Horticultural Instructor is Mr. Robert Cock, F.R.H.S., 11, Meyrick Road, Stafford.—GRAHAM BALFOUR.

SURREY.—Mr. J. Wright, F.R.H.S., V.M.H., of 8, Rose Hill Road, Wandsworth, S.W., is chief instructor and inspector. The Surrey C.C. has no central experimental garden for training professional gardeners. The Surrey routine is (a) affording instruction to amateurs and cottagers on vegetable, fruit, and flower cultivation, for making their gardens as productive and their homes as attractive as possible; (b) conducting experiments with various manures on all kinds of important garden crops on differing soils in suitable districts; (c) conducting trials of the more useful vegetables for ascertaining the best varieties to cultivate; (d) instructing over 300 youths (each on a separate plot) in the "principles and practice involved in the profitable cultivation of a cottage garden or allotment." Training and encouraging the sons of the industrial classes to become hearty, intelligent, expert workers on the land is a prominent object in the Surrey garden teaching. Many of the youths do their work as well as any man could do it, and have, on the average, increased the productivity of their plots by over 100 per cent since the teaching commenced. All work under identical conditions in the supply of seeds, manure, and instruction, and are rewarded by prizes and certificates according to the merit marks obtained. Over 5,000 crops have been grown this year. Assistant instructors are Mr. Alex. Dean, F.R.H.S., and Mr. Horace J. Wright, F.R.H.S.

SUSSEX.—The name of the lecturer on horticulture engaged under the Education Committee of the East Sussex County Council is Mr. W. Goaring, Haywards Heath, Sussex. I herewith enclose copy of the prospectus of the Agricultural and Horticultural College, Uckfield. If you will refer to page 20 you will find the syllabus of the lectures which are delivered in the county, also particulars of the fruit garden at the training farm attached to the said college are given in the prospectus.—EDWIN YOUNG, Secretary, County Hall, Lewes.

WARWICKSHIRE.—The County Instructor in Horticulture is Mr. H. Dunkin, Coventry Road, Warwick.—A. H. WHIPPLE.

WESTMORELAND.—No permanent Instructor in Horticulture has been appointed, but arrangements have been made for the following to give lectures, demonstrations, &c.: Mr. E. W. Payne, Fulwood Park Nurseries, Preston, and Mr. G. Shotton, Pant House, Felton, Northumberland. We have no experimental garden.—CHARLES J. R. TIPPER, Secretary, Lowther Street, Kendal.

WILTS.—The Instructor is Mr. T. Sharp, Westbury, Wilts. No garden.—C. H. COBBETT, County Offices, Trowbridge.

WORCESTERSHIRE.—The Instructors in Horticulture are Mr. James Udale, Ombersley Road, Droitwich (appointed September, 1891) and Mr. Joseph Lansdell, St. Wulstan's Crescent, Worcester (appointed September, 1899). There is a county experimental garden at Droitwich, established January, 1896, of which Mr. James Udale is superintendent. There are also eighteen centres in the county for the instruction of youths in the theory and practice of horticulture, under local teachers, at which 275 youths receive instruction, the whole being under the supervision of Mr. Udale.

YORKSHIRE.—Professor Seton writes: The clerk, Joint Agricultural Council, County Hall, Beverley, and the director, Education Department, County Hall, Wakefield, have handed me your letters, and in reply thereto I may say that our Instructors on Horticulture are (1) Mr. Thos. Redington; (2) Mr. Alfred Gaut. Assistant Instructor, Mr. Frank Redington. Letters addressed to "The Yorkshire College, Leeds," will find each of the instructors. The old kitchen garden at the Manor Farm, Garforth, has been slightly extended for the purposes of experimental work. The prospectus of this department, and an illustrated pamphlet, which I send, may interest you. I also enclose a copy of the "proposals" of the Yorkshire Council for Agricultural Education, in which you will find full particulars regarding the educational gardens established by the Council throughout the County.—R. S. SETON, Department of Agriculture, Yorkshire College, Leeds.

**Vanda cærulea.**

*Vanda cærulea* is one of the most popular in the genus, its beautiful blue flowers never failing to arrest attention. It is often treated to far too much heat, and is never so satisfactory as when growing in a light, airy house not any warmer than where *Cattleyas* thrive. Its roots seem to delight in being packed closely together, consequently small pans or baskets only should be used. Its flowers appear in autumn, when Orchids usually are scarce, and lasts well in good condition till December. A smaller species, *V. cærulescens*, comes from Burmah and makes a very pretty basket plant. The spikes are many-flowered, these individually being pale mauve, with a deeper purple or violet lip.—A-BRISTOL GROWER.

**Vanda insignis.**

*Vanda insignis* is a strong growing plant, flowering in early summer, its blossoms large, the sepals and petals yellowish brown, the lip rose and white. It likes a moderate heat. The popular *V. Kimballiana* is one of the finest of *Vandas*, easily grown in a cool, light house, and presenting a fine flowering return for the little trouble necessary in its culture. It may be grouped several together in flat pans or baskets, or grown as single-stemmed plants. I prefer the latter plan, as made-up plants do not always flower all over simultaneously, while the restricted rooting space is also beneficial. This plant dislikes overhead watering, but a slight spray on hot days may be allowed.—B. G.

**"The Orchid Review."**

This interesting magazine of Orchidology for last month contains notes on the collections at Kew, Chelsea, Bradford, and Highbury; also communications and notices in reference to *Cattleya x granulosa*, *C. x Hardyana*, *Masdevallia tovariensis*, &c.; Orchids from seed, Reversion in *Odontoglossum*, and other subjects. The price is 6d. monthly, from the Editor of "The Orchid Review," Lawn Crescent, Kew.

**PHAIOCYMBIDIUM x CHARDWARENSE.**

We are indebted to "The Orchid Review" for the following references and descriptions of this new bigeneric hybrid. Our illustration is from a drawing by Mr. G. Shayler. "It may be remembered that last year a very remarkable hybrid from the collection of G. F. Moore, Esq., Bourton-on-the-Water, was exhibited under the above name (*O.R.*, x., pp. 117, 190). Two flowers have now been sent by Mr. Moore's present gardener, Mr. W. Page, with the following note:—'The enclosed is a supposed hybrid between *Phaius Wallichii* x *Cymbidium giganteum*. It has been shown at a R.H.S. meeting, and there was some doubt as to its parentage by those who saw it there, but according to the records of our seedlings, it must be correct, because it is the only *Phaius* cross recorded. The plant, so far as I can see, is identical with *P. Wallichii*; there is nothing in the growth of the plant to suggest *Cymbidium*, but the flower certainly looks to me as though it has *Cymbidium* strain in it. We have about two dozen seedlings, three of which are in flower, and are the same as the samples sent.' The two flowers sent are typical *Phaius* in structure, but one is much smaller than the other, the sepals measuring respectively 1½ in and 2½ in, while the spur of the larger is five lines long, and the other only three lines. The sepals and petals are deep yellow at the back, slightly suffused with light coppery brown in front in the smaller flower, and more strongly so in the larger. The ground colour of the lip is deep yellow, striated throughout on the inside with deep maroon brown. The margin is distinctly undulate, while on the disc of the larger flower occurs a pair of fleshy keels, and a few short hairs on the surface of the lip. Mr. Page has pollinated one of the flowers with *Cymbidium giganteum*, to see whether a second crossing will not bring out more of the *Cymbidium* character. It is interesting to note that there are also seedlings obtained from *Zygopetalum x Mackayi* x *Cymbidium giganteum*, and Mr. Page remarks that they seem large enough to flower at any time. The event will be awaited with curiosity, as it may prove to be another case of monolepsis. We should like to see an attempt made to reverse these crosses. It must now be added that the plant was exhibited at the R.H.S. meeting on October 27 last, and was awarded a First-class Certificate. It was like a strong *Phaius Wallichii*, with spikes over a yard high, and was very effective."

**The Week's Cultural Notes.**

Now that work among Orchids is slack, it is well to look round and see in what way the press of work later on may be

eased, and what can be carried out now. Those who take a real interest in their work will always find something requiring attention. *Thunias*, for instance, are now quite at rest, the leaves all fallen, and the annual roots dead, their work being over. These do not really need repotting for another month or two, but this would bring us to a busy time, and as they can be repotted now with just as satisfactory results, it is well to do so.

Preparation of the compost will be the first consideration, good fibry loam mixed with a third of peat, and a liberal sprinkling of chopped sphagnum and finely broken crocks making an excellent medium for the new roots. Many growers mix a small quantity of a good concentrated manure or a larger amount of dried cow manure with it, but though a stronger growth may result I should advise beginners to be very careful in the use of either. A 5 in pot is quite large enough for the strongest of single stems, but when three or five are grouped together the pots must be larger in proportion, and in all cases especially well drained plants with several stems make a fine show; but the principal objection I have to them is the fact that the stems do not always flower simultaneously, and then the result is not pleasing. After repotting, the specimens must be stood in a warm house, and the compost kept quite dry until growth, and eventually roots, make their appearance. It may be noted that growth in all cases precedes root action, and although few Orchids like more moisture than healthy-growing plants of *Thunias*, yet just at this stage mentioned they may be ruined by an overdose of water.

Much the same may be said of the Indian Crocuses, as the various species of *Pleione* are called, but as the flowers of these charming plants appear in the centre of the young forming growths, and not at the apex like those of *Thunias*, it follows that the dry state must not be unduly prolonged, for often roots are to be seen starting at the time of repotting. The deciduous species and hybrids of *Calanthe*, too, may have attention as soon

**Phaiocymbidium x Chardwarenses.**

as the flowers are past, the treatment being almost exactly the same as for *Thunias*. Being dwarfs, the plants may be placed close up to the glass on a shelf in the lightest part of the East Indian house.—H. R. R.

**PRINCIPLES OF AMERICAN FORESTRY.**—A volume of 334 pages, with seventy-three illustrations, mostly half-tones, has just been issued by John Wiley and Sons, New York. The author is Samuel B. Green, of the University of Minnesota. The work is exceptionally practical and readily adapted to the beginner, and valuable as well to him who has already made extensive plantings.

**PROTECTION OF FRAMES.**—Do not leave necessary protecting until severe frost or snow arrives. If the frames are of brick or wood, and rise some distance above the ground, they will require at least a foot wide of leaves or straw manure boxed in all round them. Have the protecting materials as dry as possible and board over the top snugly to throw off water and snow. Mats and wooden shutters should be had in readiness. Give the latter a coat of paint, both for appearance sake and to make them wear. Where frames are level with the ground a thick bedding of litter or leaves over the surface of the ground will exclude a lot of cold.

## NOTES

## NOTICES

**Guildford Chrysanthemum Show.**

The secretary of the Guildford Chrysanthemum Society sends us a newspaper report of the recent show, which he says was highly successful and very meritorious. Two weeks ago we described one of the groups that was shown there, and which was a model in effective arrangement.

**Trinity Grove and its Gardener.**

It is with much pleasure that we notify the honour done to Mr. A. McKenzie, the gardener at Trinity Grove, Edinburgh, by a Leith newspaper, which gives his portrait and a biographical sketch. Trinity Grove is the residence of the Provost of Leith, and is endowed with memories of past notabilities, and the gardens are the most charming of any having a suburban character that we have seen.

**Annual Meeting of the N.R.S.**

The twenty-seventh annual general meeting of the National Rose Society will take place at the rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Thursday next, December 10, at 3.30 p.m.; to receive the report of the committee; to pass the accounts; to elect the committee and officers for the ensuing year; and for a proposed alteration of By-Law 5 and Regulation 1. The annual dinner will take place immediately after, Mr. H. V. Machin, vice-president, in the chair.—E. MAWLEY, Hon. Sec.

**Practical Help in Plant Naming.**

In the Brighton Museum, observes the "Daily Chronicle," a plan has been adopted that is of great interest and educational value. Persons are encouraged to bring in fresh bunches of local wild flowers, culled during their walks, to one of the officials, who arranges the specimens each morning in glass vases containing water, and affixes both the botanical and English names. It is pleasant to see the air of refreshment with which the surprised visitor, jaded by a weary round among geological specimens, stuffed animals, &c., pauses before the stand containing the vases and looks for the name of some flower whose prettiness has struck him in his rambles, and to which he now, as it were, obtains a formal introduction.

**Mutual Improvement Societies.**

The Paignton (Devon) gardeners had a "Question Night" on the occasion of their recent meeting. Questions as follows were put: Do you consider Parsley a vegetable or a herb? Are Antirrhinums, Gladioli, and Roses perennials? What is the best and safest treatment for scale on Pear trees? From what section of Carnation is the Malmaison raised? Do you know a more interesting and diversified family than Solanums? \* \* The Devon and Exeter Society was to have had Mr. Shrivell to lecture on Chemical Manures, but having missed his train in London he could not reach Exeter. The meeting therefore (which had assembled) proceeded to deliver itself of the experience held by its members on the subject, and a profitable evening was passed.

**The Golden Flower.**

On reading the remarks in last week's number, page 491, under the heading: "The Golden Flower," I find your photographic correspondent has got mixed in reference to Mr. G. Hall's exhibit of 12 incurved Japs, which you say won for him the silver challenge cup and a gold medal. In the first place the challenge cup was awarded to Mr. Hall for 36 Japs, 12 varieties, 3 of each, shown in vases, and better flowers, I am sure, have not been seen this year; and, secondly, I feel sure the 12 incurveds illustrated in the Journal did not belong to Mr. Hall. Your correspondent told me that he had an unfortunate accident with the plates of the best exhibits, and hence the confusion in the description that appeared. I hope you will, in justice to Mr. Hall, have the matter corrected.—C. S. FUDGE, Southampton.

[We relied on the notes sent by our correspondent, and regret that a mistake was made. It is especially satisfactory to be able to say now that Mr. Hall's flowers were of such high excellence.—ED.]

**The R.H.S. Journal.**

The volume up to October has been issued, but our review of its contents has had to be held over for another week.

**Mr. W. Horne sen.**

We regret to learn that Mr. W. Horne, of Perry Hill, Cliffe, near Rochester, has had a very serious illness, and was unable to be present at the sale of fruit trees and Potatoes held by his firm last week. There was a slight improvement in his condition on Monday.

**Gardening Appointments.**

Mr. H. Foster, for some years foreman in Hadsor House Gardens, Droitwich, and formerly of Strathfieldsaye and Warwick Castle, has been appointed head gardener to F. E. Muntz, Esq., Umberslade, Warwickshire. \* \* Mr. A. Garner, late foreman in the gardens at Wellesbourne House, Warwick, has been appointed head gardener to General Gunter, at Boston Hall, Boston Spa, Yorkshire.

**Sheffield Chrysanthemum Show, 1901.**

The Sheffield Chrysanthemum Society's next show will be held on Friday and Saturday, November 11 and 12, 1904. Judges: Messrs. H. J. Jones, D. B. Crane, H. Weeks, and T. Welch. The schedule is being thoroughly revised and brought up to present requirements, and will be issued early in the new year. Readers may have one by sending a post-card to Mr. M. H. Willford, secretary, 96, Greenlawn Street Walkley, Sheffield.

**Liverpool Botanic Gardens.**

The Begonia Gloire de Lorraine is grown here in large quantities, and the plants are arranged in masses along the front staging of the warm houses, interspersed with groups of Cattleyas and other choice Orchids and Ferns. Especially noticeable is the effect created by large baskets filled with this Begonia, hung throughout these houses. Later batches are in readiness to keep up the supply, so as to extend over as long a period as possible. We are pleased to hear that this has been a record year as regards numbers passing through the houses—hundreds of the general public taking the advantage placed before them. For general floral display these gardens are second to none, and must be most gratifying to the Parks and Gardens Committee in having such a "curator" in charge.—J.

**Missouri Botanical Garden Destroyed.**

In our issue for July 18 this year, Shaw's garden described from its foundation to the present. This garden, we now learn with regret, was visited by a most destructive fire early Saturday morning, November 7. The boiler house, which supplies heat for the Orchid range and several of the growing houses, was completely destroyed. Half the East India and Mexican houses were a wreck, as were also portions of the Orchid and succulent propagating houses. From a monetary standpoint it is estimated that 1,000 dollars will cover the loss to the buildings, and 2,500 the loss in plants. The latter loss is much greater than the figures indicate, as a large number of species and varieties, 200 in number, will require years to replace. This is especially true in the Orchid houses, which, while not destroyed entirely, were subjected to heavy smoke and intense heat. The collection of Selaginella, representing 28 species, was completely destroyed, the heat being so intense that the heavy zinc labels were melted down to the soil in the pots. Among the varieties lost were a number of Staghorn Ferns, such as *Platycerium grande* and *P. æthiopicum*. Among the Palms were single and grand specimens of *Licuala grandis* with a spread of 10ft; *Martinezia caryotæfolia*, *Licuala Jeananceyi*, *Dæmonorops Melanochaetes*, *Chamædorea Ne Plus Ultra*, *Hyophorbe Verschaffelti*, and *Linospadix Petrickiana*. The *Nepenthes*, insectivorous plants, and many of the finest *Anthuriums*, such as *A. Veitchi*, were badly damaged. Of the collection of Orchids, which comprised about 600 species and varieties, there were only 75 species uninjured. A remarkably fine specimen of *Cattleya Percivaliana*; *Angræcum sesquipedale*, all of the *Vandas*, and perhaps the finest collection of Florida Orchids in the United States, are in the ruins. *Cypripedium* x *Wm. Trelease*, a cross between *C. Rothschildianum* and *C. Parishii*, was also badly damaged. It was one of the most beautiful *Cypripediums* in the garden, and was highly prized, as it was named in honour of the director of the garden.

## Gardeners' Proverbs.

We do not often find a gardener represented in a novel or play as one of the characters, but there are specimens, and these show some variety. We have a gardener appearing as a man who has plenty to say upon many subjects, and rather inclined to be jocose. Again, we have the gardener quite different, not at all inclined to talk, not even about the weather and his plants, unless questioned, with a suspicion of sulkiness! The latter description is exaggerated, yet it comes nearer to the character of the average gardener, who is usually a thoughtful man, therefore, like most thinkers, not inclined to be voluble. One thing we notice about gardeners of the past—they were somewhat fond of quoting proverbs. These were of two kinds—proverbs or sayings connected with the weather and garden work, and proverbs which had a reference to the influence of plants upon human life. That all these rested only upon fancies we would not assert.

One saying, familiar to many farmers and gardeners, has naturally been discussed this moist season. It exists as a five-lined versicle, but in its briefest form is simply thus: "Oak, smoke; Ash, splash," which sounds enigmatical. An old belief was that the season's prospects were indicated by the leafing of the Oak and the Ash. If the Oak had the start, a smoking hot summer might be looked for, but if the Ash took the lead, then the splashing of frequent showers was foretold. There could be no question about the wetness of the summer of 1903; the doubtful point is, which tree came first into leaf. Both are rather late, and often expand their buds about the same date. Conflicting statements have come from the observers of Nature in our island, but the majority seemed to think that the Ash was in advance of the Oak. Just now, we are hearing people allude to the notion that an abundance of wild berries portends a hard winter, especially when there is a great display upon the Sloe or Blackthorn.

"Many stones, many groans" is a common saying in the West of England, alluding to the poverty and illness that may be expected, though it has been argued it applies to the indigestible character of the fruit. But really, this is a mere fancy; some of our recent mild winters have been marked by a profusion of berries. The truth is, the abundance or scarcity of these depends upon the number of blossoms, and how far the autumn favours their development into fruits. Many have doubted whether "A green Christmas makes a fat kirkyard" is true, as a mild winter favours the weakly and aged. But then it has been remarked that the green Christmas is apt to be followed by a cold and stormy spring, which is distinctly unfavourable to health.

In the garden more grows  
Than the gardener sows.

This proverb is indeed true, and has been very much before us during the moist summer, when weeds of all sorts showed signs of rapid increase. Owing to the weather, and other interruptions, frequently gardeners could not deal effectively with many of these pests, and so saw the proverb verified that "Ill weeds grow apace." Warning of the danger of neglecting weeds lies in the couplet:

One year's seed,  
Seven years' weed.

Seven years is a good while, but certainly if the common weeds are once allowed to sow themselves, we shall have trouble in clearing them from beds and borders. "Ill weeds fear no frost" is scarcely correct as to the bulk of them, though some seem unaffected by cold. No doubt, in the old style gardens, it was observable that plants we now call weeds were allowed to grow, for various reasons. Thus, a bed of the Wild Chamomile or Matricaria was a usual sight, concerning which they had a proverb, "The more you tread it, the more you spread it." It has even been surmised that the leaves were put into stews—a way of taking a bitter tonic which would not suit modern taste. Proverbs connected with Parsley tended to discourage its cultivation, which may account for persons often getting poisoned by gathering what they took to be the wild herb.

"Sow Parsley, and there will be a death," is still believed in some English counties; also it was deemed unlucky to transplant it and change the place of a bed. This is curious, because the plant was thought wholesome, and it was a symbol of victory in the Greek games. Fennel, too, had a bad repute—"He who sows Fennel sows sorrow"—yet this was one of the plants held sacred to St. John.

But I am acquainted with a gentleman who admires the plant so much that he has named his residence "Fennel House."

Eat Leeks in Lide, and Ramsins in May,  
And all the year after physicians may play.

This comes rather hard upon the doctors, but certainly our ancestors were fond of pungent vegetables, and had great faith in them. But when is Lide, which we infer is earlier than May in the year? Aubrey states that Lide is March, the *loud* or roaring month, the sprouting Leeks being evidently recommended as a spring purifier. The Ramsin is said to be the wild Garlic, a somewhat offensive plant, abundant about fields and woods of the west counties. Perhaps the name was also given to the cultivated Garlic.

We may find more proverbs connected with the Apple than with any other tree, several referring to its wholesomeness as a fruit. This one cuts against the medical profession:

Eat an Apple going to bed,  
Make the doctor beg his bread.

Mean people are said to "Give an Apple where there is an orchard," and a girl too particular in choosing a sweetheart suggested the proverb, "She will go after Apples till she gets a Crab." We may possibly have a doubt whether the proverb is true, that "the higher the tree, the riper the fruit"; we presume it rested upon an idea that a tall tree would get more warmth from the sun. "The rotten Apple injures its neighbour" pointed a moral; it was a reminder how soon evil influences spread themselves. Success is not to be had without effort, for "He who would have the fruit must plant the tree," but he may not have all the benefit of them; "He who loves others plants trees." Some proverbs allude to the choice of time for planting fruit trees, or removing them. "If you would have good fruit you must bury the leaf," is thought to indicate autumn as the proper season. Then we have a couplet upon the subject:

Set them at Allhallowstide and *command* them to grow.  
Set them at Candlemas and *entreat* them to grow.

Probably the remark, "He's not worth a curse"—or it may be pronounced "cuss," rather contemptuous and vulgar—has been heard by most readers; it is a curious example of a word transformation. It really meant that the person spoken of was not worth a "Kers," or Cress, comparing him to a cheap and common object—a line of Chaucer's proves this. Still, the Cresses were always esteemed for their wholesomeness, though some, from their sharp qualities, were thought to affect the nose, hence called the "nose twitchers," or Nasturtiums. "Eat Cress to learn more wit" was an old bit of advice. There used to be a funny saying in Devonshire, when a girl had jilted or refused some admirer, "She has given him Turnips"; and in some parts of England people will remark to a pale person, "You have been rubbing Turnip juice into your face." The advice, "Eat Peas with the King, and Cherries with the beggar," suggests that the stones of this fruit prevent us from eating them gracefully. "It will be a nosegay to him as long as he lives" was a proverb applied to a person who had done something wrong, the effects of which would cling to him. When anybody tried to do harm but was foiled, some of the old gardeners used to say, "He jumped at it like a cock at a Gooseberry," and fowls, if they happen to get amongst bush fruit, may be seen acting just in that way.

Such comparisons as "white as a Lily," "sweet as a Rose," "cool as a Cucumber," explain themselves. "Dear as Saffron" recalls the time when that article was much valued and expensive. "Blake as a paigle," we discover, means yellow as a Cowslip. "Every Bean has its black," a reminder that nothing in our world is perfect. It seems to us that Beans must in the olden time have been much cultivated, that is, Broad Beans, for the period of sowing is referred to in several proverbs. Some partiality was shown to Candlemas, as being suitable when the weather was mild and moist.

Sow Beans in the mud,  
They come up like a wood.

—J. R. S. C.

CELERY FOR RHEUMATISM.—Celery is most palatable if stewed or boiled in water till soft, drained on a hot dish, and eaten with butter melted, not melted butter. Season with salt and pepper. Seakale is excellent this way, too.—C. H., Salop.

### The Uncut "Journal."

Not the *Journal of Horticulture*, which was the pioneer among gardening newspapers to cut the edges of its pages, and greatly did we welcome the change. The "Journal" referred to is that of the Royal Horticultural Society. On past occasions your correspondence columns have testified that there are others beside me who feel that, in order to satisfy a petty sentiment which dominates some Fellows of the Society, the members at large have to bear a very unnecessary infliction. Here is the latest volume of the R.H.S. Journal. It numbers 418 pages, with the exception of the advertisement folios, which *are* cut. Imagine the precious time that is absolutely wasted in the painful performance of unnecessary labour, which can be accomplished in one second by the movement of a cutting machine! It is more than annoying; and only those who have to work from early morning till late at night for their daily bread, can appreciate how irritating are little hindrances like this. Nor have all of us glass-faced bookshelves, so that the ragged edges of the Journal are like a velvet curtain, catching all the dust that flies.—(HELSONIAN.)

### Horticultural Travellers.

"A. N. Noyed" certainly cites an exceptional case on page 490 in his indictment against nurserymen's representatives. In all my dealings with travellers, never have I known an offer of cash made, and never before heard of one being made. That the gentlemen of the road are somewhat of a nuisance at times we are all aware; but alack! like the rest of us, they must live. That the necessary pushfulness attaching to their calling may occasionally, in an individual, degenerate into brazen effrontery scarcely justifies gardeners in branding all comers with the appellation of "Mr. Nuisance." Knowing something of the precarious nature of the livelihood of some of these men, my sympathies have frequently been with them when it has been my duty to say "No, thank you." They may at times hold out that charming inducement to buy, viz., 5 per cent. or 10 per cent. discount; but what of that? Their employers often act very similarly. It is years since I have experienced any annoyance from a traveller's visits. Gardeners should be courteously decided in their answers. I do not believe in the necessity for dodging these gentlemen, and I certainly should think the gardener who would play "hide and seek" with them the greater part of a day was either lacking in decisiveness or had more time to play with than many of us possess. The visits spoken of by your correspondent as being so annoying could at any time be stopped by a note to the firm or firms represented. "Live and let live" we are all ready to cry, and the old adage may well be extended in its application to horticultural travellers.—PROVINCIAL.

The tirade on this worthy section of the world's business men, by one apparently annoyed, is to say the least of it, amusing. Personally I have always enjoyed the visits of our erratic brethren, and whether they booked an order or not, we have always parted the best of friends. Therefore I must strongly protest against the contumely laid at the door of the average horticultural traveller. He is not infrequently one who spent part of his life in gardening, and if not, he is very much in possession of the knowledge of the manner he should conduct himself inside the precincts of a gentleman's policies. I have not, thank goodness, yet come in contact with the specimen who struts like the peacock about the garden quite oblivious to the presence of the head gardener or his employer. No, I must say, those I have enjoyed—and they are not few—were gentlemen who had every regard for the little civilities and courtesies peculiar to a gentleman's establishment. The traveller's duty is to make sales, but the gardener's duty is to buy nothing that he can do without. Both, therefore, in the majority of cases, understand their relative positions, and can enjoy a crack on several topics, and part as good friends as they met. Dear me, what kind of a fellow can he be who runs to hide himself from the traveller? Has he got an impediment in his speech or faculties when he so dreads to meet the voluminous talk of an honest man who solicits your patronage? He certainly must be deficient in moral courage; and let me tell you when such is the case, such a person is not able to conduct a place of any importance. He may launch himself and his employer into a mess at any moment.

You have all heard of "Facing the Music." Well, my exhortation is Face it, then, and you will conquer more than

lying in a damp mushroom cellar for the best part of a day. I came across, in my peregrinations, one or two of the acidulous natured gardener, who has no room in his heart for anything or anyone outside his own selfish ends. In my apprentice days we—both boys—used to have a very much worse traveller to deal with, viz., the book canvasser. I confess I was persuaded once to enter into a big thing for me, then, and didn't I regret it! Nor do I get in the least annoyed now at the most persistent of men whose calling such is. I tell them in the outset, my mind, and strange to say they somehow know that I mean what I say, and there's an end to it. Let us hear your correspondent's version of the other side. He has given us the darkest, I am sure he can also give us a good word, for the hard working travellers.—COMITES.

### A Crimson Chrysanthemum.

Herewith I send you a bloom of a new Japanese seedling Chrysanthemum, which is, in my opinion, much the nearest approach to red or crimson of any variety. A strong point in favour of this variety is the manner in which its surface colour is exposed. It is not like so many of the new varieties, half surface and half of the reverse seen at the same time. As you will note, the bloom is large enough for any purpose, and in point of colour it is quite unique.—EDWIN MOLYNEUX.

[Placing the bloom on our desk, so that the light falls fair upon it, the colour is seen to be a very bright crimson, especially toward the centre. The reverse of the florets is pale primrose coloured; and each floret is broad. For colour alone it is decidedly interesting.—Ed.]

### Public Halls for Floral Exhibitions.

The assertion in a recent issue of the *Journal* (page 460) as to the prohibitive price charged the Sheffield Chrysanthemum Society for the use of the Cutlers' Hall, would break the back of many societies with less grit than seems to animate the members of that admirable body. Surely a society which, I believe, has consistently assisted the funds of the Gardeners' Royal Benevolent Institution with its surplus revenue in the past, is worthy of more magnanimous local concession than has presumably been meted out to it in the matter of reasonably rented hall accommodation the last three or four years. That a reserve fund should have to be drawn on to meet the seemingly high rent levied by ambitious landlords, seems hardly consistent with the love of flowers, and the advancement in mind and body of the Sheffield artisan (speaking for the amateurs) who seeks, after working hours, the purlieus of greenhouse and garden to relieve the monotony of the sulphurous works of the city: works that are controlled by those capitalists who, I am assured, have not sufficiently grasped the ends and aims of such societies, or else they would use their great influence to divert that power into the balance that would favour the continued success and prosperity of such an old and deserving society as that at Sheffield.—ALBERT F. UPSTONE, Rotherham.

### Diseased Potatoes.

As the Potato disease has been so very prevalent this season I am tempted to give a few notes on the behaviour of a few varieties during this, the wettest summer on record. The soil here is a clayey loam, and the subsoil is white clay, consequently it pays best to dig in dry or frosty weather (no time to trench), otherwise the soil runs together, and will not work properly the whole summer if dug just after rain. That grand all-round variety, Up-to-Date, gave by far the best returns, both for its cropping and disease-resisting qualities. Out of sixty bushels we only had half a bushel of diseased tubers, and almost a total absence of "chats," the smallest among them really being good, average-sized seed-tubers. Sir John Llewelyn cropped well, but a large percentage of tubers were diseased, though many did not show traces of disease until being peeled. Syon Prolific did not justify its name this year, for it gave a light crop, and though the tops succumbed early to disease, there was scarcely a diseased tuber found in the whole of fifteen rows. All of the Potato rows were 5½ yds long. Snowdrop, on the other hand, on a similar-sized brake, was fully three-parts bad, and had an enormous quantity of "chats," or small tubers. This variety had the appearance of turning out well, for the haulm, during July and August, looked remarkably well. Sutton's Flourball cropped well, and there were not many diseased. Centenary furnished small, badly-shaped tubers, with a large bulk diseased. Sutton's Ninetyfold fully bore out its name, but a larger quantity of diseased tubers I never saw. We planted 2½ bushels of seed and got barely one bushel of sound tubers in return. The whole of these were used up the first week after lifting, as I shall not grow it again.—A. JEFFERIES, Moor Hall Gardens, Harlow, Essex.

### Large Plants of Lorraine Begonia.

I should like to say that I have a very fine batch of Gloire de Lorraine Begonia. I have between two and three dozen plants, and some of them are 4ft through, and 3ft 3in high, each a mass of blooms. I should like to know if this is a record size, as I have been told that the record size was 3ft through and 2ft 6in high.—J. CLUES, Stockgrove, Leighton Buzzard.

### Help for Gardeners' Orphans.

A very pretty and successful show was held in the Woodliffe Hall, Wargrave, on November 18, by members of the Wargrave Gardeners' Association, in aid of the Royal Gardeners' Orphan Fund. Last year was the commencement of a Chrysanthemum show, when all the proceeds were given to the Gardeners' Royal Benevolent Institution, £11 19s. 6d. being taken. This year over £15 was taken, and will be sent to the R.G.O.F. I think too much praise cannot be given to the gardeners of Wargrave and district for the way they have worked to make the show a success. When we consider that there are no prizes or certificates whatever given, it shows the goodwill of all. Many bring plants from a distance, and the employers are pleased to assist also. Surely if a small village like Wargrave can make such a show, other places could, and help our gardening charities, besides giving great pleasure to those who come to see the exhibits, and acting beneficially on the gardeners in the various neighbourhoods. I trust these few lines may wake up other associations to do likewise. I may say that most of the stuff shown came up to show standard.—A PATRIOTIC GARDENER.

### The Proposed Gardeners' Association.

Kindly permit me, in reference to the above object, to inform any of your readers interested in the proposed association, to state that, with the consent of the Horticultural Club, a meeting of head gardeners, convened by the recent Gardeners' Dinner Committee, will be held in the clubroom, Hotel Windsor, on Tuesday, December 15, at two p.m., when the subject can be fully considered. Naturally, the creation of an association such as is suggested must depend on the opinions held in relation to it by gardeners generally. If supported only by one or two earnest and enthusiastic men, animated by the very best ideas and desires, whilst the great body of gardeners remain quite apathetic, the proposal must fail. If, on the other hand, the desire to create such an association be general, then its future may be assured. It is most important that those who seek to promote such an organisation should have for its formation sound reasons and practical ideas. If it can be shown that an association of head gardeners can do much to elevate the gardener's status, to promote his social and pecuniary welfare, and not least, to secure for him at the hands of employers greater respect and esteem, then its existence is indeed desirable. It is well worth asking of gardeners generally, whether in all cases they fully realise the importance of their vocation, and try to live up to it? The man who morally and socially elevates himself, materially helps to lift up his vocation. Head gardeners generally are far from being satisfied with the application of so many of their young men to the study of gardening seriously. One of the objects of the proposed association is to endeavour to create, on the part of young men in gardens, higher aims and aspirations, and to be desirous of studying gardening less departmentally and more as a whole; also acquiring, so far as may be practicable, such theoretical knowledge both on practice and on science, as shall help to render these youths more able and efficient gardeners than their present lack of study creates.

It will be asked, Are not gardeners now a highly intelligent class? To a certain extent it is quite true, and it is doubtful whether any vocation could have presented a more intelligent body of workers than was gathered at the Holborn Restaurant last Michaelmas day. But there is general admission that all is not so well as is desirable. Probably there are too many gardeners. Where hundreds literally fall over each other in the scramble for a situation, is it not fair to assume that too many of these are garden failures? To restrict the output, yet greatly increase its quality, may be in the end a great blessing to gardening.—ALEX. DEAN.

The aspirations of "Hampshire," page 490, are doubtless highly creditable. If by means of an association the position of gardeners can be raised to a higher level, then by all that is best in gardening, let us have one. Many of us, though willing enough under right conditions to remain gardeners to the end, are asking, How can we win upward out of the profession rather than in it? An association might provide tests, and might be able to show that its members possessed the necessary qualifications for taking high positions, but it does not follow as an inevitable corollary that employers would take such men, or

seriously consider their merit papers. Such an association with the objects mentioned by "Hampshire," would need to be the outcome of the joint efforts of gardeners and their employers.—COUNTRYMAN.

Allow me through the Journal to place a question before its numerous readers with regard to the formation of a gardeners' association, in which my chief and myself are in hearty sympathy. We do earnestly hope that its inauguration may form one of the principal events of the new year. Considering, then, that the association is to be formed for the purpose of elevating the whole body of gardeners, would it not be a feature to allow foremen to become members also, provided they possessed the necessary qualifications, which will, in all probability, be required by such association? I presume that younger members of the profession (journeymen) will not become members, as they must, in my opinion, be foremen to become eligible for membership, and the association would be doing good in assisting them to qualify for head places. Further, any head gardener knows the value of having a good foreman under him, who is well up in all subjects: almost as well as himself. I trust this will meet the eye of some one having considerable influence, and who, being of the same mind, will bring it up when a meeting of the chiefs is called to consider the gardeners' association.—"Scot."

### Show Boards at Exhibitions.

There seems to be a danger in front, and this lies in the total abolition of the show board for Chrysanthemums and other flowers. We learn that both Edinburgh and Hull have held exhibitions this year at which no show boards were to be seen. So long as a society can offer huge prizes which will cover the increased expenses that will be necessary in order to take long-stalked flowers considerable distances, no harm can come of the change to these prosperous and wealthy societies. But if vases become universal it would appear that exhibitors must confine their efforts to more restricted areas. This of itself would be like dealing the death-blow to that broad, deep interest in the cultivation of this beautiful and useful plant. Besides, there's a sentiment of respect left, surely, for the old boards and their glorious burdens? They add variety, though the vase-arrangements are the lovelier in effect. I plead for a few show boards still.—J. D.

### Cypripedium × Godefroyæ's parentage.

In last week's issue of the Journal, page 483, I read with interest a note on Cypripedium Godefroyæ and the variety leucochilum. It is there stated that Cypripedium Godefroyæ is a natural hybrid from Siam, the parents being C. niveum × C. bellatulum. I have just flowered the cross mentioned, which differs entirely from Godefroyæ or its variety. A note upon this subject may be found in this month's issue of "The Orchid Review," page 350. It is stated there that this cross will not produce C. Godefroyæ, and so far I believe this statement to be correct. The niveum and bellatulum cross with us has small cinnamon spots on the lips and segments, instead of the large dark purple spots of Godefroyæ. The flower is identical with the latter in shape, but smaller, and the foliage is much larger than Godefroyæ.—W. P., Chardwar.

The letter in "The Orchid Review" for November is as follows:—"An interesting and beautiful series of six photographs is sent by Mr. G. Walker, gardener to H. Druce, Esq., of St. John's Wood. Mr. Walker calls attention to the account of Cypripedium × Godefroyæ which appeared in these pages (v. p. 75 and vi. p. 231), in which the conclusion was arrived at that this plant was probably a natural hybrid, and remarks: 'I should say that it is a species, for I have crossed C. niveum with C. bellatulum, producing C. × Mrs. H. Druce, and C. concolor with C. bellatulum, producing C. × Walkerianum, and both of them are distinct in foliage and flower from C. Godefroyæ, and much stronger in growth. These crosses will not produce C. Godefroyæ, and I send you photographs of the two hybrids with their parents, together with C. Godefroyæ leucochilum, that you may see the differences for yourself.' The Editor of the Review also says: 'The question referred to by Mr. Walker is a very interesting but difficult one, and it is quite easy to follow his argument with the beautiful series of photographs sent, but there are other hybrids in existence which, unfortunately, are not available for comparison. And the question of the origin of C. Godefroyæ, and its relation to C. Godefroyæ leucochilum, and to the species mentioned, was never thoroughly cleared up, as may be seen by reference to the articles cited.' Nor has any further information come to hand as to how far the species grow together or separately. Neither of Mr. Walker's hybrids are identical with C. Godefroyæ leucochilum, which itself differs from the original C. Godefroyæ. The hybrid between C. bellatulum and C. concolor which was identified with C. Godefroyæ, we have not seen. We should be glad of further information on the different points raised."

\* For the dates of some of next year's fixtures, see back pages of this issue.

### Executive Committee of the N.C.S.

The usual monthly meeting of the executive committee was held at Carr's Restaurant on the 23rd inst. The minutes of the last meeting having been read, the secretary announced the death of Mr. A. Neevell, an old member of the society, and the committee; and also of Mr. E. J. Bentley, of Ramsgate, a fellow of the society, and an annual subscriber to the reserve fund. It was reported that Miss Austey, of Norwood, who was awarded one of the Waterer Challenge Cups in the amateurs' division on November 10, had voluntarily resigned the cup on the ground that she found on the publication of the report of the show that she was not qualified to exhibit as an amateur. The secretary bore testimony to the candid and honourable manner in which Miss Austey had acted in at once taking a journey to Ealing to announce her disqualification, and expressing her regret for the error she had unwittingly committed.

A report was brought up from the finance sub-committee recommending that the cup be awarded to Mrs. Crane, who was placed second, and in consideration of Miss Austey's ingenuous action in the matter, a small silver medal be awarded to her exhibit. The secretary stated that the amount of prize money awarded at the November show was £188 5s. 6d. Medals £29 17s. 6d., making a total of £218 3s. He also made what was considered to be a very satisfactory report as to the society's financial position.

Mr. C. H. Payne and Messrs. Bevan and Witty made interesting statements as to their visit to the recent exhibition of the French National Chrysanthemum Society, a dictated report of which will appear in the next annual report. It was resolved that the date of the great show in November, 1904, should be November 2, 3, and 4, probably at the Crystal Palace. It was further resolved that meetings of the floral committee should be held at the Essex Hall on September 19, October 24, and November 21, the arrangements there being highly satisfactory. The floral committee will also meet on each of the show days, which may be arranged.

The schedule of prizes for November, 1904, was referred to the schedule revision sub-committee, and it was resolved that the floral committee be invited to dine as usual. Under the head of miscellaneous business, some criticism was delivered on the new catalogue, and the matter was referred to the classification committee for the consideration of revised lists to appear in the next report. A vote of thanks was passed to the chairman for presiding.—R. D.

### Propagating.

Excellent cuttings may usually be obtained from a large number of varieties about the present time, so they should be inserted now, rather than deferring the operation until later, if the cuttings are at all likely to become drawn and spoiled. Late flowering varieties, as a rule, may be propagated first. Those that flower at the ordinary time or midseason should follow, while it is quite early enough for October and early-flowering varieties if they are propagated from January to March, if done in pots under glass. Most of the latter may, however, be successfully rooted in cold frames, where they will grow dwarf and sturdily, making excellent plants to transfer directly to their flowering positions in March or April.

In selecting cuttings, it is best to secure those of sucker origin well away from the stems. Some varieties are very backward in producing these desirable cuttings, while others produce them too freely, necessitating thinning out the growths. The proper length for cuttings is three or four inches long, with a clean, firm, green stem. There is no advantage in selecting suckers with roots attached. They have a hard, woody stem from the beginning, and do not grow so freely as might be imagined. Shorten them to a joint, cutting the stem square across below it, and remove the bottom leaves.

Pots for the cuttings should be washed clean and dried. Single cuttings will require a 2½ in size, and if several are to be placed round the edges of a pot 3 in pots are suitable. Drainage should consist of a large piece to cover the hole, with some smaller over, covering with a little moss or fibre. Prepare the compost with two parts loam broken up finely, adding one part of sweet leaf soil rubbed through a ½ in riddle. Add plenty of sand in the compost, and also place a layer on the surface, pre-

ferably dry, so that some of it may run down the hole when making it with the blunt stick to receive the cutting. When inserting the cutting see that the base of it rests firmly at the bottom of the hole. Press the cutting firmly in its whole length by gentle pressure with the stick. Stand the pots level, and give a good watering, also carefully labelling the variety.

The next point should be the position of the cuttings. A frame having a moveable light is the best. Stand it on a stage not far from the glass in a greenhouse. The bottom of the interior may be fine ashes, which are sweet, clean, and retain moisture, and allow superfluous moisture to readily drain away. The light, or, failing that, panes of glass, must be laid over, and as every morning much water will be condensed on the inside, this must be wiped off, or the cuttings will soon damp.

A heat greater than 50 deg should not be allowed by artificial means, as it will weaken the cuttings. The aim must be to keep the cuttings fresh, then they will soon root. With careful management water should not be needed until the cuttings begin to root. If any pots show signs of becoming dry, bring them out of the frame to water, and place back again when drained. Any cuttings which may damp off remove immediately. On the first indications that rooting is commencing more air must be allowed, daily increasing it until the plants can bear full exposure.—E. D. S.

### The New Chrysanthemum, Brightness.

The variety Brightness (syn. J. H. Silsbury) mentioned by Mr. Molyneux on page 484, which was shown at Plymouth under the name Brightness, will, no doubt, prove a great acquisition. I should like to draw the attention of your readers to the fact that this same variety was certificated by the Floral Committee of the N.C.S. at the November meeting at the Crystal Palace this year, under the name of the raiser's brother, J. H. Silsbury. It is one of the select varieties raised by Mr. Martin Silsbury, Shanklin, I.W., and it is interesting to note that it came from the same head of seed as produced Mrs. F. W. Vallis, another sterling variety that has been well shown this year; at Edinburgh and South Shields amongst other places.—C. ORCHARD, Bembridge, Isle of Wight.

### At Billingbear Park, Wokingham, Berks.

Recently I paid a visit to Mr. F. Ashman, the well-known gardener at Billingbear Park, when his collection of Chrysanthemums were at their best. They were arranged in banks in the large span-roofed fruit houses, and were a sight worth seeing. Sturdy, well-grown plants with ripened wood and heavy foliage, all were of the highest quality possible. Two varieties in particular were very excellent, viz., W. R. Church and F. S. Vallis. Mr. Ashman has taken first for eighteen Japs at Ascot, first for twenty-four at Reading, and also at Wokingham this year, and he has been equally successful with fruit. One special feature to be seen at present is a large house filled with the popular Begonia Gloire de Lorraine, which are some of the finest specimens in small pots that I have seen.—J. B., Berks.

### The School of Handicraft's Garden, Chertsey.

The "Surrey Herald" says:—"A magnificent collection of these charming and popular flowers has been on view at the School of Handicrafts. The plants are massed in one of the houses and the effect is most striking, a wide range of varieties, all brought to a high pitch of perfection, being exhibited. Great credit is due to Mr. A. J. Brown, the director of the school's farm and garden, not forgetting the intelligent help of James, one of the boys. Most noticeable among the varieties is Madame Rogers, a curious green incurved bloom; Charwood, a fine lemon Japanese; Phoebus, a deep sun-yellow Japanese; Miss Cissie, a charming single bronze-red flower; African Hero, a stately bronze-red incurved; Millicent Richardson, deep mauve; Source d'Or, a beautiful golden Japanese, and many others. In an adjoining house there is a fine crop of ripe Tomatoes, the quality and condition of which it would be difficult to match."

### The Collection at Royal Kew.

From a botanist's point of view, the Golden Flower may not be attractive, but anyone visiting Kew on a fine Sunday afternoon and seeing the crowds flocking to No. 4 (the greenhouse) and also to the Temperate House, can soon tell what is the most popular flower at present with the general public. The aim in No. 4 is not to grow gigantic blooms alone, but to show the value of the Chrysanthemum as a decorative plant. Naturally grown plants, not disbudded, and others (and these are in the majority) partially disbudded, are excellent from a decorative point of view. Large blooms, however, are not neglected. All sections are represented, and the few we noted were, of singles: Victoria, Emily Wells (lovely shade of pink), Ladysmith, and Earlswood Beauty. Among pompons: Snowdrop (the plants covered with white button-like flowers). Anemone and Japanese Anemones: W. G. Drover and Sir Walter Raleigh. Incurved: Madame Ferlat, William Higgs, C. H. Curtis, Madame E. Roger (a great favourite with visitors), and Mdlle. Marie Liger.

The Japanese and Japanese incurved give a splendid account of

themselves, the best being Gny Hamilton, J. R. Upton, Madame R. Cadbury (carrying huge, ivory-white flowers), M. Chenon de Léché, H. J. Jones, Mrs. Barkley, Mrs. H. Weeks, Countess of Harrowby (a lovely shade of pink), Mr. T. Carrington, Mrs. George Mileham, and Mrs. Greenfield.

The oldest decorative varieties, Tokio and Source d'Or, are as great favourites at Kew as elsewhere, and very effective are the small plants in 5in and 6in pots, dotted amongst the usual groups on the side stages, one variety being usually restricted to one group, and these include Snowdrop, Phœbus, Crimson Gem, Source d'Or, with others.

The majority of the plants in the Temperate House are arranged in the two octagons, and are chiefly of the Japanese and Japanese-incurred types. The plants on the whole are larger than in No. 4, and more disbudding has been done, while several are carrying very large flowers. Among them may be noted Nellie Pockett, Jumbo, Cecil Wray, Henry Barnes, and Miss Alice Byron.

#### A Liverpool Collection.

The collection in the Liverpool Botanic Garden amounts to 1,400 plants, and these are grouped for effect. Eight hundred of these consist of large Japanese and incurred, which are quite up to the exhibition standard in quality, and represent all the leading varieties. What strikes us most on entering the house is the manner in which they are arranged, and here Mr. Guttridge (the curator) has struck out of the orthodox style, and has created a far more pleasing effect by introducing dot plants throughout the centre bed, thereby avoiding what would otherwise become monotonous. On the side stages of the same house is a fine display of single varieties. These prove attractive when the large blooms are on the wane. In the "large greenhouse" is to be seen a representative collection of pompons and decorative sorts, which are a magnificent show in themselves.—S.

#### English Flowers in America.

A year ago Mr. W. Wells, of Wells and Co., Ltd., Earlswood, Redhill, Surrey, sent three dozen specimen flowers for non-competitive exhibition at the show of N.C.S. of America, held at New York. The blooms had been packed with great care, and the exhibit, when staged, was pronounced to be remarkably successful, and was greatly admired. From a commercial point of view, Mr. Wells did one of the finest strokes of business he is ever likely to do, and more than a dozen of his novelties are in the front rank as exhibition varieties in the United States of America.

Mr. Wells has received a letter from a correspondent resident in New Jersey, and this letter is as follows: "I beg to congratulate you upon the excellence of the blooms you exhibited at New York Show [in November, this year.—Ed.]. All of them were very fine, and in some cases there was not a petal bruised, which goes to show the excellence of the keeping qualities and the careful packing, as the flowers must have been packed at least eleven days. You were awarded a diploma, which was well merited. In the Society or sweepstake prize, some wonderful flowers were shown, and out of twenty fine varieties no less than eleven were novelties sent out by you. Mention might be made of Leilia Filkins, Donald McLeod, F. A. Cobbold, Wm. Duckham, Gen. Hutton, Maynell, S. T. Wright, Ben Wells, W. R. Church, Mary Inglis, and Cheltoni."

Another letter from a correspondent mentions the fact that the variety W. Duckham won the American National Chrysanthemum Society's silver cup. The exhibitor had ten blooms of this variety, and speaks of them as being "Simply marvellous; everybody was staggered. My flowers were pronounced by everyone to be the finest ever seen here."

### Novelties and Rarities.

#### *Gesnera exoniensis*.

This forms a handsome foliage plant, and at the same time is one of the most brilliant of all flowering subjects. It is most excellent for furnishing the intermediate, or stove houses, during the next few months, and although it requires no special attention to secure good specimens, it is seldom seen at perfection. For flowering during the winter good-sized corms should be inserted singly in well-drained 4in pots in a compost consisting of two parts rich fibrous loam, and one each of peat and sand, about the first week in July, having the top of the corm just under the soil. These should be placed near the glass in a heated pit, or similar structure, in a temperature of about 60deg Fahr. by night, allowing it to rise to 70deg Fahr. during the day by the aid of sun heat. If the soil is in a fairly moist condition at the time of potting, water will not be needed for a day or so, and until the corms commence to root and grow freely water should be given sparingly. Encourage them as much as possible when well

started by keeping a nice, moist, growing atmosphere, and also shade during the day from bright sunshine.

When in a fit state for potting they should be transferred to 6in or 7in pots according to size, using a similar compost to the one advised before, but rather coarser and not quite so sandy; but before doing so they will each need to be tied to a well-pointed short stick to prevent their snapping off just on a level with the soil, which they are very apt to do from the weight of their leaves. After potting, the plants should be returned to their former position, and kept rather closer for a few days, and watered carefully until they root into the fresh soil, after which they can be treated as before stated. When, later on, they show signs of flowering, they can be fed a little if the pots are well filled with roots, on weak liquid cowdung manure; but this should be given sparingly.

At the close of winter, when they begin to die over, water should be gradually withheld and the plants removed to a cooler

*Crowea saligna major*.

and drier atmosphere, and when properly dried off stored away in a dry place until started again. *G. zebrina* is another equally handsome but rather weaker-growing species, which answers to the same culture. Its orange-scarlet flowers and mottled foliage form a striking contrast when grown with *G. exoniensis*.—E. B., South Berks.

#### *Crowea saligna major*.

The Croweas are less grown nowadays than formerly. They are allied to *Boronia*, and require much the same treatment. The one here figured was seen in Messrs. Veitch's nursery at Chelsea a week ago, when the pretty purplish-rose flowers attracted much admiration. We may remark that Messrs. Veitch also possess a splendid stock of *Gesnera exoniensis*, which they have recently been exhibiting a good deal.

### Bedding Rose, Cerallina.

Already this fine decorative Rose has found its place, which is in the front rank of good garden varieties. It was a pleasure to see bunches of it staged by a Norfolk firm at the Crystal Palace Chrysanthemum Show recently. The variety was sent out by Wm. Paul and Son in 1899. It is a splendid free-flowering autumnal, the flowers of fine shape and good substance, and coloured rosy red—one cannot say rosy crimson at this season; though a dry autumn would most likely increase the crimson in the petals. At all events, no one can do wrong in adding this dwarf newcomer to a collection of decorative Roses.—JOHN AVENEL.

### Crimson Ramblers for Easter.

The two-year-old plants of Crimson Rambler (observes the "American Florist") will soon arrive from the nurseries, and should be potted in heavy clay soil as soon as received. If the canes are six or seven feet long, shorten them back to three or four feet. These canes can be twisted and bent into any desired shape; they should never be left straight or the breaks will be uneven. Start them in a cool house, as near to 40deg as possible, until about twelve weeks before they are wanted in bloom, when the temperature can be gradually increased each week until 55deg at night is reached, which will bring them into flower nicely for Easter (April). Success in forcing Ramblers for Easter depends largely upon the way they are handled now. Start them gradually, water sparingly as long as there is little root action, gradually increasing the water supply as the temperature is raised and growth commences.

### Roses in America.

Like "W. R. Raillem," I have not been in America myself, but through various channels I glean a little respecting American horticulture. A friend of mine who owns a large nursery in Hants, spent some of his time in the States, and when he informed me that they grew their Roses under such a system I, like your able rosarian, was surprised. But Americans are ever after quick returns, and the methods of Carnation culture and Chrysanthemum culture for market are equally surprising. We growers would be shocked to see Mums planted direct into huge houses from the cutting bench, and kept there throughout the season. Yet they get the finest of blooms, which fetch from a quarter to a whole dollar apiece. Respecting the Roses, how could they sell 4in or 6in plants of such as Papa Gontier, Etoile de Lyon, Marion Dingee, Marie Guillot, Sunset, Rainbow, La France, Meteor, Madame Abel Chatenay, Maman Cochet, &c., at prices from three to twenty cents apiece were it not for some method of lightning culture? and that method is heat-struck cuttings. If Roses budded on the Manetti are desired one cannot get them under forty or fifty cents each. Naturally the latter give the quickest returns to the amateur, but very few are sold compared with the cutting plants, which, if allowed to do so, generally flower the same season. Some three years ago I had one of these tiny wisp-like plants sent me, the variety being American raised, named Champion of the World. I potted it, and it flowered in the house within three months. Allowing it to do so undoubtedly checked it, for not until this season has it exhibited the trait claimed—champion in growth and other points. However, the wood is not stout enough to bear good flowers, but next season, after hard cutting back, should prove it thoroughly. Apparently the flowers resemble La France somewhat, but it is a Tea, and said to be absolutely mildew-proof. Some strange points about it are its freedom from green fly and maggot, its pale foliage, which is shiny, and reminds one of a Wichuraiana. To hark back to market men, only a few varieties are cultivated, not more than a dozen or fifteen at the outside.—A. W.

### ROSE, MADAME ANTOIN MARÈ.

This Rose was raised, I think, by M. Marè, of Nice, who kept the stock for some years, but eventually consigned it to Jupeau (?) of Paris, from whom Mr. Arthur Paul, of Wm. Paul and Son, Waltham Cross, secured plants. The variety is a free grower, and was certificated in September, 1902.

ROSES, OLD AND NEW.—Mr. J. T. Strange, Aldermaston, gave an admirable lecture on "Roses, old and new" recently at Theale. He traced the history and development of the Rose from the old Cabbage, Damask, and Sweet Briar to the many beautiful kinds of the present day, gave an account of the first raising of Hybrid Teas, and referred to some of the foremost Roses grown from "sports."

## Adaptation in a Pelargonium

The illustration on the next page is interesting as an example of a double flower reverting to the single form. Of course, we have not here any sexual influence, only a morphological difference. Reversion in hybrids and crosses is hardly yet definable, although observers are fast building up theories; but where purely morphological differences evince themselves, we can trace the cause almost invariably to new conditions of culture, in garden plants, or fresh surroundings, if in Nature. This is called adaptation. Double flowers all arise from single flowers, by the transformation of stamens and pistils into petals. This cannot be traced in every instance where double flowers exist, but it can in tuberous Begonias, Water Lilies, Dahlias, and many others. In the Pelargonium here noticed, it appears that the stamens and pistil have developed perfectly, thus making the "single" flower; while in the inflorescence of the one first produced, the mal-formed or double flower was formed. The photograph came from Mr. Tyler, Halstead, Essex.

## Floral Decorations.

### REALISM IN FLORAL DESIGNS.

"The Florists' Exchange" figures a panel representative of General Grant on horseback. The frame used was a panel 5ft by 6ft, and was first covered completely with green moss, then the figures were worked out with Immortelles of the proper colours, 100 bunches of these being required for the purpose. As a finish to the formal design, the natural flowers had been exceedingly well placed. There was a cluster of Lilies at the lower left-hand corner, and a cluster of American Beauty Roses at the upper right-hand corner. The artist had known just how large to make those clusters to provide a setting for the picture without overshadowing the features of either the rider or the horse. It is not always possible to get live green moss, and in the absence of that material one would have to use the ordinary sphagnum moss instead. It would then be necessary to use green Galax, or Ivy, leaves as a covering for the moss in forming the background for the picture, though the leaves need not be placed until the figures had been worked out with the Immortelles. Around the edges of the panel, leaves that have been stemmed two or three together should be put in and left so as to stand a few inches away from the edge, thus making a suitable frame for the picture.

Another unique design that came to our notice recently was one furnished by Timothy F. Creedon, florist, at Middleboro', Mass. This was a representation of a child's cart, and was sent by sympathising friends to the funeral of a little girl whose chief pastime had been the wheeling of her little cart. A small cart, standing about 2ft high, was used as a frame; the back, sides, and foot rest were filled in with white flowers and the seat with pink. The arm rests were composed of Admiral Cervera Carnations, bordered with small pink Chrysanthemums, and Roses were used plentifully, both in the body of the carriage and on the arm-rests. The fact of our writing about realism in floral designs will not, we hope, lead to the belief that we are an advocate of that class of work for funeral occasions. At patriotic celebrations or political gatherings one can with propriety give full scope to his artistic ability, and make any design or figure that is called for; but for funeral purposes we think they are out of place.

### SIMPLE DINNER-TABLE DECORATION.

For the centrepiece a common wicker plaque is the most desirable to use. This is first filled with damp moss, then the moss is tied in place with green thread. After the mossing is completed, Adiantum or some other suitable Fern, is stemmed and used to cover the basket, hiding the moss completely, and also leaving sprays to hang well down over the edge of the plaque. The Roses are then put in position, and to have them so that they will stay firm in the moss, it is best to wire them on to the regular flower sticks. When arranging the Roses, they should never be left high enough to obstruct the view of those who are sitting at the table. Many otherwise pretty table decorations have been spoiled by the centrepiece being too high. Low effects are always the most desirable on a round or oval table, and the smaller the table the less towering should the arrangement of flowers be. From the centrepiece to within about 20in of the edge of the table, sprays of Ferns may be laid here and there. A few Roses can be placed among the Ferns to advantage, though Roses here are not an absolute necessity. We have seen fronds of Nephrolepis used in the space between the glasses and the centrepiece with pleasing effect, and that without having any flowers intermixed with them. The favours for the guests must not be forgotten; they may be Gardenias, Carnations, Roses, or Cattleyas. This mode of arrangement of a table setting can be varied at will. Carnations and Asparagus may be used in place of Roses and Ferns, or Cattleyas and Adiantum Farleyense can be substituted. This would be much more expensive.

## Gadding and Gathering.

### A School of Gardening.

Combining business with pleasure, at the time of a brief holiday in August last I visited the newly-opened Women's School of Gardening at Corstorphine Hill, near Edinburgh. The Journal has had prior notices of this school, and has already mentioned the fact that two ladies who manage the institution, the Misses Barker and Morison, graduated at Swanley Horticultural College, Kent, thence they had a somewhat varied experience in professional gardening and the laying out of places ere they eventually found anchor, for a time at least, on the coast at Musselburgh. (In using the word anchor I shouldn't have introduced the coast, should I?) And here with apiculture and horticulture their twin experiences were broadened, and of course experience has generally to be paid for. For more reasons than one it was determined to remove the school out west, Musselburgh being east, of Edinburgh. The present location can be seen by anyone journeying by train from Edinburgh toward the Forth Bridge, or Glasgow, as it lies facing the sun, on a flank of Corstorphine Hill. A little more shelter on the west, which is the direction of the prevailing winds in that neighbourhood, would certainly have been an advantage; but, all things considered, there are good gardening prospects here. One magnificent advantage possessed is the level, almost straight road right into the Waverley Market and the large West End shops in the Scottish metropolis. At Musselburgh, that had not been so. And while the products of the garden can be more easily sent into town, natural manures and other necessities for the crops can be as easily fetched out. The district is noted for nurseries and gardens of all sorts. As the two ladies have a number, and an increasing number, of girl and young women students, some of which journey back and fro from the city. It is here, again, advantageous to be so get-at-able. Cable tram-cars run out nearly the full way—a distance of two and a half miles.

The garden is about two and a half acres in extent, and has already been planted with suitable selections of fruiting trees and shrubs. One or two glass houses have also been erected, and these contained Tomatoes and Cucumbers, other plants occupying them in season. Soon there will be additions to the plant structures. The soil is of a rather stiff nature, but produces good vegetable and flower crops.

This is the only school of its kind in Scotland, and was formally opened by the Countess of Aberdeen, supported by a large company of ladies and gentlemen, some short time ago. A prominent feature of the gardens is the apiary in which the school prides itself, and it is understood that the place gives promise of being a bee-keeper's paradise. The students take part in demonstrations which are given by experts in bee-keeping and floral decoration, such as bouquet-making, table decoration, and wreaths. A certain amount of theoretical instruction is necessary, and in order to obtain this the students attend science classes at the Heriot-Watt College. This does not mean extra expense to the student, as it is included in the curriculum. Students are prepared for the Royal Horticultural Society's examinations, and a diploma is granted to students who have

passed satisfactorily, examinations in theoretical and practical horticulture, botany, agricultural chemistry, and book-keeping. Mr. John W. McHattie, the city parks and gardens superintendent, is the examiner in practical horticulture. The principals of the school have been encouraged by the number of students enrolled and by the number of applications for women gardeners which have already been received. At present there are five resident students, and a number of students come from the city. Two of the resident students are from England, two from Glasgow, and one from Saltecoats. The period of study for those who intend to follow gardening as a profession extends over two years. The fees for resident students are £70 a year, and for non-resident students £25 a year. Thus the average girl is prohibited through lack of means from taking to gardening as a profession. "What is needed (says an Edinburgh paper) is that some patron of education should found a number of scholarships for women gardeners.

The support of such a scheme might well come within the scope of the Carnegie trust at Dunfermline, and it might also receive the attention of such educational bodies as the Heriot Trust."

Notwithstanding what "Rosa Dartle" said against the lady gardener (and in a ladies' paper, forsooth!) a week or two ago, I wish the school success, for gardening is as healthful for the ladies as for "gentlemen."

### The Greenhouse, Kew.

The following is a list of plants in flower in the Royal Gardens, Kew: Begonias: Agatha, Gloire de Lorraine, Mrs. Leopold Rothschild, and Turnford Hall. Carnations: Triumphans, Snowflake, Mrs. Leopold Rothschild. Bouvardias in variety, including the new King of Searlets, with large flowers, but lacking the brilliant colour of President Cleveland. Epacris, splendidly budded, will be a sight in a week or two's time. Ericas, hyemalis and its var. alba., despite the wet and unfavourable summer for ripening wood, are covered with flowers; also E. melanthera. Peristrophe speciosa, effectively relieved with dot plants of Abutilon Savitzi. Salvia splendens, under several varietal names: grandiflora, Triumph, Glory of Stuttgart, praecox, and miniata. The two latter are dwarf forms, much alike. Calceolaria Burbidgei, flowers yellow. Zonal Pelargoniums, red colour, very effective at this time of year. Paul Campbell

seems equally as good for winter flowering as for summer bedding. Reinwardtia trigyna and R. tetragyna. Primula obconica, well grown plants covered with flower, but scarcely as bright in colour as we have seen in this house. Chrysanthemum (or Marguerite) Brousonetti, white, and Etoile d'Or, yellow. Jacobinia chrysostephara, J. coccinea, and J. Ghiesbreghtiana.—WANDERING WILLIE.

Double-flowered Pelargonium reverting to Single.

USEFUL HINTS.—Lime water is the best worm exterminator for pots or benches. A 6in pot of lime to 12gals of water. Let the lime settle before using, and there should be a few days' interval between applications of lime water and liquid manure. \* \* If you experience difficulty in rooting some kinds of stock in sand, try hard coal ashes which have been passed through a half-inch screen. \* \* Katherine Tracy is a good soft pink Sweet Pea for winter cutting.

### Profitable Varieties of Bush Apples.

Of all the forms in which Apples are grown, this is the most profitable, as well as the easiest to manage. Yet there is a right way and a wrong way of treating them, as one is often reminded when looking at other people's gardens. Some are anxious to get as many branches as possible, and let the tree become congested, with the result that the fruit-spurs in the centre of the tree die away, which is all the greater pity, as it is there that a good quantity of fruit can hang without weighing down the branches, or giving the wind a chance to knock it off.

Others, in their anxiety to get a large tree as soon as possible, either do not shorten the branches or shoots at planting, with the result that in the future there are long bare branches devoid of fruit-spurs; or else, having done this at planting, they avoid shortening the first year's growth, with the result that the buds do not break out in the spring all along the previous season's growth, and consequently a given branch does not bear so much fruit. In addition, the branch, being without foliage along some part of its length, does not thicken so rapidly, and consequently is not able to support so great a weight of fruit. This impatience defeats its own ends. Others overdo their trees with kindness, and feed them up before they have fruited, either by putting manure with the soil at planting, or by giving them liquid manure, either of which practices induces a rank, sappy growth which is not conducive to fruitfulness, and the unripened, sappy wood may be cut back in a severe winter. Others again keep newly-planted trees well watered, or rather, badly watered, and the result is the same as by manuring. If a good mulch of long manure is put over the ground occupied by the roots of newly-planted trees they will never need watering in any normal summer, and, in fact, are much best without it, as the growth is so much better ripened.

But as I have dealt with the training and pruning of bush Apples in another article, I will confine myself to a chat about a few of the most prolific bushes. One is always tempted to try new Apples about which a fuss is made, but it is very risky, as we do not know their constitution at all, and it is wiser to let other people experiment with them on different soils first.

There are so many good sorts of Apples to be got which are of well-proved merit, alike as to quality, fruitfulness, hardiness, and freedom of growth, and we may as well confine ourselves to these until we see how some of these new ones turn out. That much-advertised Apple, Bramley's Seedling, was the occasion of the remark of a fruit grower to me the other day that it was the most over-rated Apple he knew. Few probably would go as far as this. Many Apples that are very much boomed turn out to be quite inferior to many existing varieties of the same season. Of the Apples introduced during the last thirty years, it is doubtful if there are half a dozen which, if we take into account all the traits necessary to a good Apple, are any improvement upon some of the best in existence before that time.

I have Cox's Orange Pippin, Lane's Prince Albert, Mannington's Pearmain, Warner's King, Adam's Pearmain, Warwickshire Pippin, and Wellington, not to mention many others in existence thirty or forty years ago—have these been improved upon for all-round excellence? It will surprise some to hear that all of these were grown thirty or forty years ago, as it is only during the last twenty years that some of them have become well known. Some, like numbers of the great people in the art and literary worlds, have been "discovered." Many of the newer Apples, especially the American varieties, are tender, and either do not succeed in a cold wet soil, or are especially subject to canker and woolly aphis, or are slow in coming into bearing, or only develop their best qualities under very favourable conditions.

The sorts I am going to discuss are not necessarily all of the very front rank as regards quality, but they are all very good and all hardy, of healthy growth, and free in bearing, which four qualifications all, except those few gardeners who have ideal conditions for fruit growing, may be contented to accept without expecting anything more. All should be on the Paradise stock unless otherwise stated.

#### SCARLET NONPAREIL.

The first to be mentioned, not because it is the best, is the Scarlet Nonpareil. The origin of this Apple is doubtful, some saying it was found growing in a garden, and others that it was deliberately raised from seed. It is rather below the medium size unless under very good conditions and well thinned, and is of such a beautiful glowing colour that it is very often on the exhibition table. It is a medium grower, making very slender shoots, which

rather unfits it for the standard form. It is very tender and of good flavour, and is very acceptable for dessert at Christmas, being one of the handsomest in season at that time. The Royal Horticultural Society include this in their very short list of dessert Apples in their pamphlet on fruits for cottagers and owners of small gardens.

#### STURMER PIPPIN

is perhaps the latest dessert Apple, being good sometimes as late as June if allowed to hang on the tree well into November, and then carefully stored. There is not much risk in letting them hang so late, as a few degrees of frost do not harm Apples on the tree, and when there is a chance of a sharp frost, and we do not often get more than two or three before the middle of November, a covering can easily be thrown over a bush tree, especially if, as always should be the case, the extension shoots have been shortened before that time. It is of excellent quality, but needs peeling, though many do that with all Apples. It is of medium size, russety, and quite a contrast to the preceding in the matter of beauty, though getting a little colour in a favourable autumn. It is of moderate growth, seldom forming a large bush, and a very regular bearer. It will stand, and, in fact, needs fairly generous treatment, as there is little fear of its running too much to wood. It was raised at Sturmer, Haverhill, near the Essex-Suffolk border, and was obtained by impregnating Ribston Pippin with the Old Nonpareil. Both parents are prone to canker, the former especially so, but the descendant does not seem to have inherited the tendency as far as my experience goes, though it has inherited the Ribston flavour.

#### WARWICKSHIRE OR WYKEN PIPPIN.

An Apple which is not planted now so much as it deserves to be is the old Warwickshire Pippin, or Wyken Pippin, as it is often called from the name of the place near Coventry where it was raised some time in the eighteenth century. As grown on standards, which are very common in old-fashioned orchards and cottage gardens, where large old trees may often be seen a mass of yellow fruit, the Apple is rather below medium size, but grown on dwarf trees with good culture it is fully up to the medium size, and a rather handsome golden Apple, crisp, juicy, and of very fine flavour. It is of rather small upright growth and very prolific. It is in season at Christmas and for a couple of months afterwards.—A. PETTS.

(To be continued.)

### Winter Tomatoes.

A word or two on this subject will not be out of place at this season. We have here just now a small three-quarter span house, in full bearing, and it is a sight worth seeing. The plants have six and seven bunches, with four and five nice-sized fruits to a plant. My method of growing is sow the seed in May in 6in or 7in pots; plunge them in either a Melon or Cucumber pit. When the seedlings show themselves move them to a cold pit or frame until they are in their "rough leaf" state, when they will be ready for pricking-out in boxes, still keeping them cool. When they have made nice, sturdy plants 4in to 6in high, pot them straight into fruiting pots (we use 12in), using well-chopped loam, with a 6in potful of dissolved bones as the only manure. Put them back in cold pits, having stakes ready across the pit. Care must be exercised in bending plants, as the sun draws them and they sometimes snap, being so brittle. By the end of August they have set three or four nice bunches of fruit. Now take them to their winter quarters, which should be kept moderately dry and warm, say 65deg F. at night. Plenty of air on mild days is advisable, with the use of a camel's-hair brush to aid in setting their fruits. They will ripen right up to March. Where a large kitchen, with a chef, has to be supplied, they are found most useful all the winter, being much better than the shelf-ripened fruits, or those that are bought, especially for salads. The variety I find to do best is Camerons No. 3 [?]. The colour is all that can be desired, with firm, juicy flesh and very few seeds.—GEORGE T. CARVILLE, Duncombe Park Gardens, Helmsley, Yorks.

#### Apple, Ribston Pippin.

Amongst the Apples now being so largely sold in fruiterers' shops everywhere, is the Ribston Pippin; and of a surety it is not the least attractive of them. Smooth-skinned, round, about 3in in breadth and depth, and having rich crimson cheeks, the Ribston is at the same time one of the best flavoured and most productive varieties we have. It is usually chosen in the best all-round dozen. It is in season from November till January.

#### American Society for Horticultural Science.

The constitution and by-laws with the announcement of the above society have been issued. The society's first meeting, with scientific programme, will be held at St. Louis in connection with the meeting of the American Association for the Advancement of Science, December 28 to January 2 next. The date has not yet been decided on, but that and other details will be duly announced.

## Societies.

### R.H.S. Scientific Committee, Nov. 24th.

Present: Dr. M. T. Masters F.R.S. (in the chair); Messrs. Odell, Baker, Saunders, Chittenden, Worsdell, Holmes, Massee, Douglas, and Nicholson; Dr. M. C. Cooke, Professor Boulger, Rev. G. Henslow, Hon. Sec.

*Scientific investigations at Wisley.*—Professor Boulger remarked that it would be a comparatively inexpensive procedure to erect a Pine wood building on a brick foundation for laboratory, store-room, &c., probably not exceeding £100 in cost. It was proposed to add this suggestion to the memorial to the council.

*Canker in Apple trees.*—Badly diseased twigs were received from the neighbourhood of Salisbury. They proved to be attacked by *Neetria ditissima*. The only remedy suggested by Mr. Massee was to prune off all small wood and burn it, as well as to cut out diseased parts of boughs, and tar the places.

*Pear shoots disease.*—Specimen of diseased shoots was received from the Priory, Eynsford, Kent, from Mr. E. D. Till. Mr. Massee suggested the following procedure: "The twigs are attacked by a fungus called *Fusicladium pirinum*. All diseased twigs should be pruned, and, along with fallen leaves and fruit lying under the tree, collected and burned. It would be an advantage to spray the tree with Bordeaux mixture next spring, just after the leaf-buds have expanded."

*Experiments for commercial purposes.*—Mr. F. Baker reported some results of his experiments and observations on leguminous plants. For the last five years a few varieties of garden Peas, field Peas, Runner Beans, Vetches, Sainfoin, and other plants of the same N.O. have been grown on good and poor soil respectively, parts of each plot being specially well tilled, parts dunged, and parts treated with phosphatic and potassic fertilisers. Strips were arranged so that some spots should be well tilled, and also have a dressing of all the fertilisers, and other spots to vary from nearly the same treatment to the poorest field culture. Results have shown that garden Peas and Beans cannot be profitably grown in very poor soil, manured solely by mineral fertilisers; but these respond well to tillage, dung, and then the minerals. On the other hand, Vetches, field Peas, Sainfoin, and others of the older plants grown on the farm can be most profitably grown on poor soil, manured solely with minerals. Dung will largely increase the yield of stem and leaf in all, but does not materially increase the yield of seed. If, therefore, seed be required, grow on poor chalky soil without dung; but if fodder is required, dung may be profitably used as well as minerals. The experiments also show the great use of the Vetch in ameliorating the soil, greatly enriching it, and, at the same time, cleaning it very economically. It is suggested that garden plants having been for many generations forced to an unnatural extent, are not able to adapt themselves to different conditions of soil, &c.; whereas field crops which have had to seek for food to a large extent, are able to develop specially well-formed roots, which easily absorb water and such phosphatic, potassic, and other mineral plant foods as are available, and on these roots are developed large numbers of nodules by means of which an ample supply of atmospheric nitrogen is assimilated.

### Hull, Nov. 18th and 19th.

Like the Scottish Horticultural Association in Edinburgh, the Hull Society has abolished showboards entirely this year, and the change seems to have met with approval. The show arrangements were admirably carried out, and Mr. J. Dixon and Lieut.-Colonel R. E. Johnson, the hon. secretaries, may be heartily congratulated on the manner in which they performed their respective duties. The group classes were not such a good feature as usual, but the cut blooms, plants in pots, and table decorations were splendid. It is to be regretted that there were no entries in the two largest classes, viz., for 25 incurved and 25 Japanese. While there is very much to be said for the vase classes, their adoption to the total exclusion of cut blooms on boards prevents the best competitors from a distance exhibiting, for naturally flowers on long stems are less readily carried about.

*Cut Blooms.*—In the class for 20 Japs in not less than five varieties, there were five competitors, all of whom staged meritoriously. Mr. George Walker, gr. to C. E. A. Lyon, Esq.,

Apple, Ribston Pippin.

The Lair, Hornsea, led, staging blooms of Marquis V. Venosta, Sensation, Charles Longley, Madame Gustave Henry, and C. J. Salter; Mr. C. Jennings, gr. to F. W. Jameson, Esq., Aston Hall, North Ferriby, was a close 2nd, his blooms of F. S. Vallis and Lady Hanham being remarkable for finish and size. In the class for 10 blooms, distinct, Mr. G. Walker was 1st with excellent examples; Mr. J. W. Backhouse, North Bar, Beverley, was a close 2nd; and Mr. H. Harvey, gr. to G. Tether, Esq., Broxholm, Anlaby Road, Hull, was a good third. For 15 blooms, 5 each of Mrs. Dixon, Mrs. George Glenney, and Mrs. Rundle, there were 3 entries, Mr. W. Sinclair, gr. to H. Whitty, Esq., Cottingham, being 1st; 2nd, Mr. Anthony Drewery, gr. to W. H. Franklin, Esq., Cottingham. Three vases of decorative brought out a keen competition. 1. Mr. G. C. Coates, gr. to S. L. Haldane, Esq., Hull, with a pretty display; 2. Mr. H. Taylor, florist, Newland, Hull; 3. Mr. G. Cottam, Alma Gardens, Cottingham. Five Japs one variety (7 entries). 1. Mr. George Walker, gr. to C. E. A. Lyon, Esq., The Lair, Hornsea, with Mrs. George Milham; 2. Mr. H. Harvey, gr. to G. Fletcher, Esq., Broxholm, Anlaby Road, Hull, with Rev. Douglas; 3. Mr. Anthony Drewery, gr. to W. H. Franklin, Esq., Cottingham, with Lady Hanham. There were 6 competitors in the class for 20 blooms, in not less than four varieties and the premier award, a silver cup and cash prize, was won by Mr. J. W. Backhouse, who had John Agate (the premier bloom in the open classes). Mr. C. T. Flower, gr. to R. Hodgson, Esq., Molescroft, Beverley, and Mr. H. Harvey were placed thus. For 10 blooms of incurved Mr. C. Jennings, with grand blooms led; Mr. J. W. Backhouse was 2nd. The prizes for a vase of 5 blooms of any one variety of Japanese, were awarded to Mr. G. Walker, Mr. H. Harvey, and Mr. A. Drewery, gr. to W. H. Franklin, Esq., Cherry Garths, Cottingham. For 10 Anemone blooms 3 entered, and 1st, Mr. G. C. Coates, gr. to S. L. Haldane, Esq., Coltman Street, Hull; 2. Mr. J. W. Bearpark. Ten reflexed blooms (2 entries). 1. Mr. Anthony Drewery, gr. to W. H. Franklin, Esq., Cherry Garth, Cottingham; 2. Mr. J. W. Bearpark, Hull. Twelve bunches of pompons (5 entries). 1. Mr. G. C. Coates, gr. to S. L. Haldane, Esq., Coltman Street, Hull; 2. Mr. W. Sinclair, gr. to H. Whitty, Esq.; 3. Mr. Anthony Drewery, gr. to W. H. Franklin, Esq., Cottingham. Twelve bunches of singles (6 entries). 1. Mr. G. C. Coates; Mr. Anthony Drewery 2nd; 3. Mr. W. Sinclair. Eight classes were specially provided for amateurs, and in all of them the competition was keener than usual, notwithstanding the change that was made in the method of staging.

*PLANTS (OPEN).*—Group of Chrysanthemums and other plants, 1. Mr. G. Cottam, Alma Gardens, Cottingham, with a very light exhibit; 2. Mr. Whittaker, Cliff House, Hull; 3. G. Thorpe Wilson, Esq., Brantingham Thorpe, Brough. Mr. G. C. Coates, gr. to S. L. Haldane, Esq., Coltman Street, Hull, was 1st for a mirror panel group of Chrysanthemums and other plants; Mr. John Foster, jun., Newland, 2nd. Chrysanthemum plants suitable for table decoration. 1. Mr. G. C. Coates, gr. to S. L.

Haldane, Esq., Hull, with an excellent group; 2, Mr. W. H. Young, Worthing Street, Beverley Road, Hull.

### Aberdeen Chrysanthemum, Nov. 20th and 21st.

The annual show was held on the dates given, and was very successful, there being 700 entries. Mr. M. H. Sinclair is secretary. Those staging honorary exhibits were Messrs. W. Thomson and Sons, Limited, Clovenfords, near Galashiels, who had a display of Grapes cut from Vines which have been heavily cropped for the past thirty-three years, and these Vines were nourished by Thomson's Vine manure. Messrs. Cocker and Sons, Aberdeen, had a collection of new varieties of Potatoes all in fine condition. There were other exhibits. The leading prize for a semicircular group of Chrysanthemums was taken by Mr. John Proctor, gr. to Sir William Henderson, Devanha House, Aberdeen; 2, Mr. F. Munro, Stoneywood House; Mr. G. Maitland, Woodside, 3rd. Mr. W. Patterson, Park, carried off the premier honours for 12 vases Japs, 12 varieties, beating Mr. W. M. Moir, Rosehaugh, Ross-shire. In the class for 24 blooms in 12 varieties, Mr. W. Patterson, Balmedie, led; 2, Mr. John Grigor; and the 3rd by Mr. John Petrie, Crathes Castle. For 18 Japs in 9 varieties the lead was taken by Mr. Ed. Joss, Sunnyside House, Montrose. The 2nd prize went to Mr. Frank Fraser, Tillery House, Uddry; and the 3rd to Mr. G. Barbour, The Knoll, Elgin. Mr. A. Murray had the best 12, he was followed by Mr. George Jamieson, Burton Hall, Loughborough; and 3rd, Mr. G. G. Stuart, Aden House, Mintlaw. In the class for 12 incurveds the 1st and 2nd prizes were secured by Mr. George Jamieson. For 6 incurveds, 3 varieties, the lead was taken by Mr. W. Patterson, Balmedie, who was followed by Mr. J. Pirie, Strichen House, and by Mr. A. Brebner, Dalhelly, Cults, in the order named. In a class for 12 varieties of Chrysanthemums Mr. James Smith, Grantown-on-Spey, took the lead, followed by Mr. John Sim, Glenburnie, Park, and Mr. A. Douglas, Kippleston.

### National Chrysanthemum, Annual Dinner.

The annual dinner of the members was held last Wednesday week in London, there being a large company present, and presided over by Mr. Charles E. Shea. After having proposed the loyal toasts, the chairman spoke to the toast of the National Chrysanthemum Society, and said how gratified he was at having been asked to become president. He embraced the present opportunity to thank the members for the honour done to him, and then proceeded to give a brief review of the society's history. It had had a continuous record since 1846, when it was established as the Stoke Newington Chrysanthemum Society. Mr. Robert James was the founder of that body, and of the original members, two were alive in 1896, namely, Arthur Walkley and J. George.

In those early days, to raise and stage twenty-four distinct varieties was practically an impossibility to most gardeners, and a class for twenty-four only drew forth two competitors, the Huttons, father and son. One nurseryman was able to stage twenty-four in his section of the schedule.

In 1862 and 1864 it seemed that things were becoming critical (said Mr. Shea), for the officers were presenting testimonials to the chairman (a silver snuffbox), and in 1864 the secretary got a silver cup. Not only did the society, however, survive this: other societies caught the idea too.

In 1874 the name was changed to the Stoke Newington and Hackney Chrysanthemum Society, and in the following year to the Borough of Hackney Chrysanthemum. The first show, held in the Royal Aquarium, Westminster, was in 1877, and a year later, Mr. Wm. Holmes was elected secretary. Then in 1884 came the most important change of any, the change to the name it still bears, and the suggestion, "by a stroke of genius," was due to Mr. Henry Cannell, of Swanley. By one proclamation (continued the chairman) we annexed the British Isles, for everywhere there are votaries of the great Autumn Queen. Mr. Harman Payne became a member also in 1884, and subsequently the official catalogue was published. Lord Brook was then president, and the secretary having died, Mr. Richard Dean was appointed in his stead. These were milestones in the journey; others were the Jubilee celebrations in 1895, the Chrysanthemum Conference, and lastly the transfer of their place of exhibition to the Wesleyan Methodists. This rendered them homeless, so to speak, but the Crystal Palace had been their refuge. The president said that it rests with the committee to see what the Crystal Palace means. He thought it a crying shame that in this great city they could not have a suitable hall, and the new hall of the Royal Horticultural Society would be too small.

The foregoing facts were the direct history; the indirect history lay in the development of the Chrysanthemum to what it is to-day. In France, in Germany, in Australia, and the U.S.A., the golden flower is increasingly popular. Mr. Shea drew attention to a statement in one of the gardening papers which accused the large Chrysanthemums with being the means of depraving public taste. "But if this flower has grace, finish, beauty, colour, &c., is mere size a crime?" he asked, in accents of reproach and surprise. Is there a deliberate intention in the

case of the Rose or any other flower, to say, "Thus far, and no further, in size?" Mr. Shea thought not; and said that surely there is room for all types of blooms. He called on Mr. Cannell to say a few words.

Mr. Cannell took his hearers with him back to a show at Stoke Newington in 1851, where there were no cut flowers, so far as he remembered, and only a few large plants. Mr. Cannell had attended all the shows of the National. In 1851 the fashion was all for incurved varieties, and it was the Stratford people who first brought forward the Japs. Mr. Robert Fortune introduced some long-tasselled varieties from Japan, and these were distributed. All the varieties of to-day had come from these. Geo. Rundle (incurved) came into existence in 1860; and George Gleny was another of the oldest. Mr. Cannell suggested that it would afford unbounded interest if a class could be set aside for those old favourites of forty years ago that have fallen out of the ranks. This concluded the two most interesting speeches of the evening. There were, however, numerous others in connection with the various toasts. The shields, cups, and medals

Mr. C. E. Shea, President N.C.S.

won at the November show were presented to the winners of them. In replying to the toast of the chairman, Mr. Shea remarked that he had grown his plants from the "cutting" to the staging of a first prize forty-eight blooms at an N.C.S. show. He traced his progress from 1886, when he first began as an exhibitor, till 1891, when he gave up. The meeting broke up about 11 o'clock.

### Dundee Chrysanthemum, Nov. 27th and 28th.

The annual exhibition of this spirited society was held in the Drill Hall, Dundee, on Friday and Saturday last, and was equal, and in some respects superior, to any of its predecessors. The entries had increased by nearly a hundred, while the quality of the exhibits was, generally speaking, little if any behind those of much larger and more ambitious exhibitions. The hall and the exhibition seemed to suit each other admirably, the arrangements were tasteful, and to the eye of the ordinary visitor the whole presented a most attractive appearance. The principal competitors in the cut bloom classes were Mr. Beisant, gr. at Castle Huntly, and Mr. D. Nicoll, gr. at Rossie. These two well-known growers met at Edinburgh, when Mr. Nicoll gained the much-coveted leading prize, and Mr. Beisant was 3rd. At Dundee, Mr. Beisant turned the tables on his rival, and scored 1st in both the leading classes.

CUT BLOOMS.—For 12 vases in 12 varieties, 3 blooms of each, Mr. Beisant was first with large, fresh, even blooms. The most prominent were Duchess of Sutherland, Madame Cadbury, Sensation, Mrs. Barkley, Elsie Fulton, F. S. Vallis, and Mrs. Mileham. Mr. D. Nicoll, Rossie, was a close 2nd with similar varieties, Madame Cadbury, F. S. Vallis, General Penford, and Miss Florence Molyncux being very conspicuous. For 6 vases, Mr. Adams, St. Clements, Forfar, was 1st with good, fresh blooms, containing fine Elsie Fulton, J. R. Upton, and W. R. Church. Mr. Buckbie, of Linfield, West Ferry, was a good 2nd. For 24 blooms on boards, Mr. Beisant took 1st place with very handsome flowers of leading sorts; Mr. Nicoll was 2nd; and Mr. Cumming,

who gained 2nd place at Edinburgh for the Scottish champion class, was a very creditable 3rd, running the others very closely. For 18 blooms in 3 separate colours—white, yellow, and purple or mauve—Mr. Beisant was again 1st; and Mr. Johnstone, Ramornie, 2nd. In the amateurs' class for 12 blooms, not less than 6 varieties, Mr. J. Higgins, Anstruther, was 1st with a very pretty stand, closely followed by Bailie Melville, Dundee, who would have won the challenge cup if he had obtained premier place this time, but though very near he was doomed to disappointment. Better luck next time, worthy Bailie!

Vases for effect are always well shown at Dundee. The dozen vases of singles shown were superior to anything seen this season. Vases of undisbudded blooms were also good. Baskets and bouquets were beautifully shown, and had a most artistic appearance. A display for effect on a circular table, 6ft diameter, of cut flowers, flowering plants, and any foliage in pots or cut. This prize brought 3 competitors, and arranged in the centre of the hall had a very beautiful effect. First position was accorded to Mr. Fairweather, gr. to Lord Provost Barrie. The leading features were cut Chrysanthemums and Poinsettias, beautifully relieved with Cocos Weddelliana and other foliage. Mr. Beatts, gr., Binroch, was 2nd, with a very graceful exhibit but not so massive as the other.

Plants were fairly numerous and of fine quality. The class for 6 pots were as well grown as any we have seen this season. First place was secured by Mr. Scott, Seathwood—N.C.S. Jubilee and Lady Audrey Buller were very fine; 2, Mr. Kinnear, Fernbrae. In a class for 6 plants in 6in pots Mr. Beatts, Binroch, led with Nellie Pockett. A competition for plants grown by juveniles was very interesting, a large number of plants were shown in this class, and the quality was very good. Of miscellaneous plants there was a fair show. Table plants were specially well done, and the 1st prize lot in a competition for 4 winter-blooming Begonias in 7in pots were perfect. The grower of these (Mr. Saunders) deserves the highest praise.

Fruit was a small show of fair quality. Vegetables were numerous and good. The 1st prize collection of 8 kinds from Mr. Kinnear, Fernbrae, were fit for any show. All were good, but Cauliflowers, Celery, Leeks, and Onions specially so. Other vegetables in separate classes were well shown.

**NON-COMPETITIVE EXHIBITS.**—The exhibits of the local trade added greatly to the beauty of the show. They were not only numerous; but of great interest and attractiveness, and in beauty of arrangement excelling the exhibits at many of the larger exhibitions. The most popular was a very pretty exhibit of floral designs by Messrs. Laird and Sinclair, Dundee. They had handsome designs of a lyre, a harp, and an upright cross of Violets and Roses. There were also a number of very pretty bouquets, one of Daffodils reminding the onlooker that spring, with its complete change of flowers, will soon be upon us.

Messrs. D. and W. Croll, Dundee, had an extensive exhibit of plants and cut flowers, and a number of floral designs.

Messrs. Storrie and Storrie's exhibit was characteristically well arranged. It had many good things, but their splendid plants of a very rich form of *Salvia splendens* were most prominent, adding a brilliancy to the whole exhibition. Other plants were also well shown by Messrs. Storrie as the special products of their "Invincible" liquid manure.

Messrs. Thyne and Paton had a nice exhibit of various winter plants, and Mr. Grossart also put up an attractive table of plants and handsome floral designs. The Ichthemie Guano Company, Ipswich, exhibited samples of their well-known manures on a table richly decorated with Palms and cut Chrysanthemums.

Unfortunately, the weather was most unpropitious during the two days of the show, in consequence of which we fear the money drawings at the door were not in proportion to the merits of the exhibition.—NORTHERN SCRIBE.

### Potatoes at the Cattle and Root Show, Birmingham.

Despite the somewhat untoward season, Potatoes were remarkable for quality throughout, and a similar remark equally applies to the Swedes and Mangolds. In the class for the best new variety of Potato not yet in commerce (12 tubers), the Duke of Portland was accorded the 1st prize (£1) for an unnamed, very handsome, smooth-skinned and small, shallow-eyed tuber variety like Satisfaction. The 2nd prize fell to Mr. S. T. Parker, Scotforth, Lancaster, with Duke of Lancaster. For the most handsome dish of any variety Messrs. F. Williams, Thornbury, and Benjamin Parker, Scotforth, won respectively; each with Satisfaction. For one variety (round), Messrs. F. Williams and S. T. Parker each won with Satisfaction. For one variety (long or kidney shaped), the positions of the last-named winners were reversed, with Satisfaction and Sensation respectively. In the class for 12 varieties (1st prize £5), the veteran exhibitor, Mr. D. H. Wells, Tysoe, near Kineton, repeated his last year's feat of annexing the 1st prize with an excellent complement of British Queen, Vicar of Laleham, Abundance, Edgemoor Purple, Satisfaction, Up-to-Date, Mr. Bresee, Goldfinder, Lord Tennyson, Reading Russet, Webbs' Goldfinder, and The Dean, every dish of which was as perfect as Potatoes need be. Mr. B. Parker was 2nd and 3rd; there were four other entrants.

For 6 varieties Mr. S. Parker won with fine specimens of Satisfaction, Peerless Rose, Lord Roberts, Cramond Blossom, Edgemoor Purple, and Sutton's Reliance; 2, Mr. D. H. Wells; and 3, Mr. B. Parker. For 4 varieties, 2 white and 2 coloured, Mr. F. Williams was 1st with Satisfaction, Evergood (a model), Pink Perfection, and The Dean; 2, Mr. D. H. Wells; and 3, Mr. B. Parker. For 4 varieties most suitable for field or farm culture (12 tubers each), Mr. F. Williams was to the front with Up-to-Date, Satisfaction, Ideal, and Evergood—altogether a shapely lot. 2, Mr. S. T. Parker with good examples of Lord Roberts, Reliance, Cigarette, and Satisfaction. Mr. F. Williams in the class for 2 varieties (kidney-shaped or long), was placed 1st, with fine examples of Satisfaction and Sensation; 2, Mr. O. Roberts, Tarporley, with Ideal and Reliance; 3, Mr. B. Parker. For 2 varieties (round), Mr. F. Williams won with Satisfaction and Pink Perfection. There was a total of fifty-five entries.

### South Shields and Northern Counties Chrysanthemum.

Nov. 25TH and 26TH.

This very popular exhibition is another instance that in the North the growth and admiration of the Chrysanthemum is not on the downward grade. There are good men at the helm, and a body of enthusiastic workers, who each and all combine to obtain the necessary sinews, and carry out the work in a most laudable manner. The bouquets and epergnes are always a great feature at South Shields, and this year they were better than ever. A whole table down the centre of the spacious hall of the Royal Assembly Rooms was filled with magnificent exhibits, the well-known firm of Messrs. Perkins and Sons, Coventry, again entering the list, and dividing honours with the northern champion, Mr. Jas. Summers, of Sunderland. The very choicest Orchids and other flowers were used in the arrangements. The cut blooms of Japs and incurveds were generally well up to the standard. The colour was bright and clean. The vase classes were represented only by two or three small exhibits. Perhaps the executive may be able to find room another year for a good prize for large flowers in vases, as Edinburgh, Hull, and the N.C.S., do, and which is now becoming popular with most societies, although it cannot justly be said with all exhibitors.

Five silver cups were offered in addition to valuable money prizes. Mr. F. S. Vallis won the 15 guinea cup offered for 36 Japs against nine competitors, with a very bright stand of good quality. This is the second consecutive win, and thus becomes his property. In this stand there was a fine bloom of Mrs. F. W. Vallis, measuring 9in by 10in. This, and a fine bloom of F. S. Vallis in another exhibit, were selected as the two best Japs in the show, and after consultation, in which all four judges took part, the bloom of Mrs. F. W. Vallis was awarded the premier place.

**CUT BLOOMS: JAPS.**—For 36 in 18 varieties, 1st prize (by the President of the Society, James Readhead, Esq., J.P.), and £6 in cash (£5, £3, and £1 10s.), went to F. S. Vallis, Bromham, Chippenham, with Mrs. F. W. Vallis, Mrs. Hummell, Bessie Godfrey, President Viger, F. S. Vallis, Mafeking Hero, Mdme. Herreweghe, W. R. Church, Kimberley, Mrs. Whereas, J. Penford, Suzie, and J. H. Silsbury, amongst others. Mr. G. E. Thomas, gr. to the Marquis of Ripon, Studley Royal, Ripon, was a very good 2nd with a bright, solid stand; 3rd, Mr. Jennings, gr. to F. W. Jamieson, Esq., Aston Hall, North Ferriby; 4th, Mr. James Harcastle, gr. to S. C. Salkeld, Esq., Holm Hill, Dalston, Carlisle. Mr. J. Corbett, gr. to the Marquis of Normanby, Mulgrave Castle, Whitby, and Mr. G. MacDougall, gr. to H. Pease, Esq., Arcot Hall, Dudley, also exhibited good stands, only a point or two behind the others.

In the class for 18 Japs, Mr. Vallis was again 1st with a stand of his usual quality; 2nd, Mr. J. Corbett, with a good lot; 3rd, Mr. G. E. Thomas. For 12 Japs Mr. Vallis was again 1st; Mr. Harcastle, 2nd; with Mr. Spowart, gr. to J. White, Esq., Low Fell, 3rd.

**INCURVEDS.**—In the class for 36, in 18 varieties, for which Mr. Alex Purvis offered a five-guinea challenge cup, and £6 in money (other prizes of £4, £2, and £1), two very even stands were staged. The first went to Mr. Jennings for a stand of blooms even and fresh. The best being Mr. J. Agate, R. C. Kingston, Miss Southam, Hanwell Glory, Chas. Curtis, Lady Isobel, Golden Empress, Wm. Higgs, Miss E. Seward (very good), and F. Southam. Second prize to Mr. Thomas, for a stand that contained some very fine blooms in his back row. Mr. Thomas was more fortunate in another class for incurveds, being 1st. The classes for amateurs and local exhibitors were well contested, and contained many very creditable exhibits. Mr. T. N. Alexander offering a five-guinea cup for 18 Japanese, with £1 10s. in money for 18 Japanese, which was won by Mr. T. Reay.

**GROUPS.**—For a group of Chrysanthemums and other foliage plants, Mr. C. F. Sutcliffe offered a silver cup, value £5 5s., with a money prize of £5, 1st prize. (Other prizes of £4, £2, and £1). The cup was won by Mr. T. Pattison, gr. to W. C. Gray, Esq., West Hartlepool, with an undulated group that contained some choice Orchids, and showed much taste in the arrangements. The 2nd went to last year's winner, Mr. Geo. MacDougall, who

had the heaviest Chrysanthemums, but there was a scarcity of flowers and a lack of finish in the front part of the group. Mr. Thos. Reay was 3rd, with a bright bank of flowers.

**BOUQUETS AND EPERGNES.**—As previously mentioned, these are special features at South Shields. The display created a great attraction to the very large body of visitors. In addition to the 1st prize of £2, for a bouquet, an additional special prize of £2 2s. is offered. Messrs. Perkins and Sons, Coventry, were 1st with a very light and elegant arrangement in their well-known style; 2, Mr. Jas. Summers, florist, Sunderland, whose group was heavy in the body; 3, Miss Dora Summers; 4, Mr. Webster, Sunderland. In the corresponding class for a bridal bouquet, Mr. Jas. Summers was 1st, Messrs. Perkins and Sons following very closely. For an epergne, Mr. T. Pattison, West Hartlepool, was 1st, and Mr. J. Summers 2nd. For a Chrysanthemum epergne, Mr. T. Battensby, Blaydon, was 1st. The other local classes for epergnes were very creditable. For ladies' sprays and buttonholes Messrs. Perkins and Sons, G. Hilliar (Darlington), J. Summers, and T. Battensby were the most successful exhibitors.

The show of vegetables in the basement of the hall was a very fine one, but the fruit, as in other places this year, was scarce.

A very effective collection of Celosias, Chrysanthemums, and other plants was staged in front of the orchestra by Messrs. Clibran and Son, and a table of winter-flowering Carnations, in vases, came from G. Boyes and Co., Aylestone, Leicester. Others contributed non-competitive groups.

To the Hon. Secretaries, Mr. Bernard Cowan, F.R.H.S., and Mr. Thomas A. Binks, Mr. Alex. Purvis and Mr. J. E. Stout (chairmen of committees), with Mr. J. T. Reed and Mr. C. C. Walton, Hon. Treasurers, much of the success of the show is due; and the staging was ably carried out by Mr. J. Thompson and Mr. A. C. Wood. The judges were: For cut blooms—Messrs. J. W. Moorman, Victoria Park, London; C. Orchard, Bembridge, Isle of Wight; and Mr. M. D. Thompson, gr. to Sir Lindsay Wood, Bart., Chester-le-Street, and Mr. R. Robson, Superintendent, Blythe Park.—C. O.

### Scottish Horticultural Association.

The monthly meeting was held on the evening of Tuesday, December 1, in Dowell's Rooms. There was a very large attendance of members, and after the nomination of nineteen life and over a score of ordinary members, Mr. Smale, gardener Blackford Park, Edinburgh, read a most interesting paper on "Hybrid Streptocarpus and their Culture." Mr. Smale began his remarks with an account of the introduction of the various species of Streptocarpus and their hybridisation, mentioning that Messrs. Veitch, of Chelsea, had been the first in the trade to introduce the present race of hybrids. Mr. Smale then, in a lucid and very interesting way, described his practice in raising and cultivating from seed, from cuttings, and from division of the roots. Mr. Smale's paper was highly instructive, and was listened to with the greatest interest. An animated discussion followed, taken part in by Mr. Comfort, Mr. Whyttock, Mr. Grieve, Mr. Lamont and others. A most hearty vote of thanks was awarded to Mr. Smale.

Exhibits were not numerous, but were very attractive. Mr. Wood, gardener, Oswald House, sent a very beautiful specimen of *Cattleya labiata*, with about twenty blooms. Mr. Smale exhibited (in illustration of his paper) a beautiful vase of Streptocarpus, very varied in colour. Mr. Davie, seedsman, Haddington, exhibited specimens of his new Potatoes—Dunoon, King Loth, and Warrior. Mr. Todd, florist, Shandwick Place, exhibited a very handsome vase of *Souvenir d'un Amie*, grown for decorative purposes; also a very beautiful vase of forced Daffodils.

After a short statement as to the financial results of the recent highly successful exhibition, it was agreed that next year's Chrysanthemum Show be held on November 17, 18, and 19, 1904.

### Royal Meteorological.

The opening meeting of this society for the present session was held on Wednesday evening, the 18th ult., at the Institution of Civil Engineers, Great George Street, Westminster: Capt. D. Wilson-Barker, F.R.S.E., President, in the chair. Dr. H. R. Mill and Mr. R. G. K. Lempfert gave an elaborate and interesting paper on "The Great Dustfall of February, 1903, and its Origin." From the maps exhibited it appears plain that the dust reported on February 21 or 22 fell over nearly all parts of England and Wales to the south of a line drawn from Anglesey to Ipswich, except in parts of North Cornwall, Somerset, Wilts and mid Wales.

The dust usually attracted attention either in the form of a dense yellow haze, like a London fog, or as a reddish-yellow powder lying thickly on trees and roofs. The fall was often accompanied by temperatures considerably above the average and by remarkably low relative humidities. In order to ascertain whether the composition of the dust threw any light on its origin, about fifty samples were submitted to the Geological Survey, and examined by Dr. J. S. Flett. In addition to the

coarser particles, all the samples contained a very fine grained reddish clay, the particles of which were too minute to be determined mineralogically. This clay was certainly derived from some source beyond the British Isles, but it was not distinctive enough to afford much evidence as to its place of origin. Maps have been constructed showing the distribution of the dust and the meteorological conditions prevailing over the period when it appeared. These form the basis of a discussion by Mr. Lempfert as to the place of origin and the direction of travel of the air which was passing over Western Europe at the time in question.

The trajectories of the air which reached the southern half of England can be traced backwards in a south-westerly direction to the neighbourhood of the Azores, but here it turns to the south, and finally to the south-east, and is carried back to the north-west coast of Africa on the morning of the 19th. The authors are therefore of opinion that there is reason to believe that the air which reached the southern half of England on the 22nd started from the north-west coast of Africa on the 19th, and they consider this affords strong evidence of the African origin of the dust, and of its having travelled to North-west Europe by a path not very different from that indicated by the trajectories.

### Metropolitan Public Gardens.

**OPEN SPACES.**—At the monthly meeting of the Metropolitan Public Gardens Association, held at 83, Lancaster Gate, W., the Hon. Dudley F. Fortescue, Vice-Chairman, presiding, a communication was received from the recently formed Midlands Re-forestation Society, and it was agreed to express the warm sympathy of the association with this movement for planting with trees the ugly waste heaps which occupy so large an area of the "Black Country." It was agreed to ask the Metropolitan Borough Councils to co-operate in appealing to the House of Lords against the recent decision of the Court of Appeal, whereby it was held that buildings could be erected upon the boundaries of a public recreation ground, thereby depriving it of sunlight and air, instead of being set back a reasonable distance therefrom, as would be the case if the ground were privately owned.

It was stated that the London School Board were arranging to acquire Wycliffe Chapel, Stepney, and the extensive disused burial ground belonging to it, for school purposes, which might lead in the future to the appropriation of this valuable space for building purposes in contravention of the Disused Burial Grounds Acts, and it was decided to ask the Board to choose some more suitable site for a school, and one which would be free from this objection. Correspondence was read with the London County Council in reference to St. Peter's Square, Hammer-smith, which is in danger of being built upon, the Council feeling unable to contribute to the cost of purchase owing to the excessive price. Great interest was shown in the proposals of the Council for securing the preservation of London square gardens and similar enclosures, inasmuch as the association had been instrumental in acquiring and laying out some twenty grounds of this character, which the public now enjoy, but since the Council had become a purchaser at building values, it had not been possible to acquire such sites by negotiation as heretofore.

It was decided to await the embodiment of the proposals in a Bill before expressing an opinion thereon. Progress was reported with regard to schemes for acquiring an extension to Hampstead Heath, Springfield Estate, Upper Clapton, and the Norfolk Square area, Islington. Proposals for tree planting in Bedford Row, W.C., Queen's Road, Battersea, St. Thomas's Street, S.E., Brixton Road, St. George's and St. Saviour's Churchyards, Battersea, were agreed to, and it was decided to ask the Governors of St. Thomas's Hospital to preserve the triangular space in Lambeth Palace Road. Schemes for dealing with churchyards in Poplar and Stratford, West Square, Southwark, and many other sites were under consideration.

### Wargrave Chrysanthemum Show.

The object of this show is referred to under "Readers' Views." In this place we furnish a short report. A. B. Gill, Esq. (gr., Mr. W. Pope) had a very effective group of foliage plants. Mr. M. Brodie, gr. to S. Platt, Esq., showed a large bank of Chrysanthemums. Mr. T. Powell, gr. to Mrs. Noble, had a large group of specimen stove plants. Mr. A. McKenzie, gr. to Mrs. Groves, a group of well-grown Chrysanthemums and foliage plants. Mr. G. Wicks, gr. to Mrs. Lawrence, a splendid table of dwarf Chrysanthemums, Begonias, Palms, Cyclamens, and Ferns. Mr. W. Scott, gr. to Captain Coleridge, a large table of well-grown Gloire de Lorraine and Turnford Hall Begonias. Mr. Turnham, gr. to W. H. Barber, Esq., filled a large space with cut Chrysanthemums in vases. Mr. Bazely, Twyford Nurseries, sent a group of Succulents and a harp of Chrysanthemums. Mr. Priest, gr. to J. Tarbutt, Esq., a table of foliage plants. Mr. Goddard, gr. to C. S. Henry, Esq., a long table of well-grown Primulas, Chrysanthemums, Cyclamens, Ferns. Mr. Strachen, gr. to Lady Donaldson, a splendid exhibit of cut Chrysanthemums arranged with grasses. From Park Place came baskets of Lilies, fruits, berries, foliage, lyre of Bougainvillea, new Potatoes, &c.

Mr. Stanton made a novel exhibit in autumn tints, also skeleton leaves and fruit on velvet. Lady M. Mackenzie's gardener put up 4 vases of cut blooms. Mr. Brodie and Mr. G. Wicks staged some fine examples of Grapes and Apples. Mr. T. Haskett, gr. to J. W. Rhodes, Esq., staged a large collection of vegetables; also Messrs. Strachen and Wicks. From Mr. Dixon came a table of fretwork done in spare moments.—J. BOTLEY.

### Reading Gardeners.

The usual fortnightly meeting was held on the 25th ult., the president, Mr. Leonard Sutton, presiding over a good attendance of members. The subject for the evening was "The Seeding of Chrysanthemums in England," and was introduced by Mr. Pole-Routh, Oakfield, Reading. The paper proved to be a very interesting one, and a good discussion followed, in which the president, Messrs. Barnes, Bassel, Alexander, Wilson, Wicks, Dore, Judd, Stanton, Neve, Exler, Tufnall, and Winsor took part. The exhibits were a feature of the meeting. Honorary: Group of seedling Chrysanthemums, several of the plants carrying large blooms, by Mr. Pole-Routh; seedling Chrysanthemum plants by the president; cut blooms of Chrysanthemums (24 vases) raised from seed sown in January, 1903, by Messrs. Sutton and Sons; two specimen plants of *Daphne indica* growing on their own roots, and a vase of *Ranunculus* by Mr. Harris, The Gardens, Mapledurham House. For the certificate, 24 table plants, by Mr. Wynn, The Gardens, "Samoa," Reading. The plants were well grown, and the certificate was awarded.

### Manures.

#### Phosphates for Fruit Trees.

To the old-time gardener, the value of dung obtained from various sources was usually estimated by its appearance, and the observant faculties of those thoroughly practical men usually enabled them to arrive at a pretty correct estimate of the value of the various materials at command, in regard to their suitability for the culture of the majority of crops. Modern scientific research has, however, enabled us to gain a far better knowledge of the principal constituents of manures, and of their effect when applied separately, and the gradual spread of this knowledge is developing more economical methods of manuring. It is now generally understood that nitrate promotes growth and increased vigour; phosphate, fruitfulness and early ripening, and the latter also ensures firmness of texture in the growth of trees and crops. Potash increases the store of sugar, and therefore improves the quality of fruits.

The cultivator who thoroughly grasps these principles is in a far better position to manure effectively, yet economically, than one who regards manures of all descriptions as being so much material for promoting growth of some kind or other. This lack of definite knowledge was formerly undoubtedly the greatest factor in causing practical men to look upon dung as being the best of all manures, and also gave rise to the erroneous idea that trees and crops which grew too strongly when dung was applied, should have manure withheld entirely. Because heavy dressings of dung caused young fruit trees to grow too strongly, many became imbued with the idea that fruit trees generally required no manure, and that idea was to a great extent contributory to the production of the inferior samples of fruit seen on starved trees. Old trees, when bearing good crops, are undoubtedly benefited by heavy dressings of farmyard manure; but there are other trees which, although growing strongly, may be improved and rendered more fruitful by the application of one of the constituents which go to form a complete manure. The great fault of dung as a manure for fruit trees is that when using it we cannot apply the constituents separately, therefore in some cases trees receive an additional quantity of what they have already had too much. This is especially the case in regard to nitrate. Although there can be no growth made unless the three plant foods above recorded be present in the soil, it is nevertheless possible for the presence of too much nitrate to cause the production of improperly developed, hardened tissue; and then the result is strong, unripened wood.

The value of phosphates in fruit culture has not received the attention from practical growers that it should, and a much freer use of some form of phosphatic manure would, I am convinced, benefit fruit-growers in this country immensely. We must not attribute all the failures this year to the spring frosts, for unripened wood which produced imperfectly developed flowers, was also largely a contributory cause, and regular efforts should be made to ensure the production of the right kind of wood in the future. Trees have this year made a great amount of strong growth on account of the heavy rains and the absence of fruit to check growth; and although a thorough thinning of the branches at once may do something to assist the wood, other means should be taken to secure the right type of growth next year. The

application of phosphates to trees which have grown strongly will do much good in this respect.

On stiff land, basic slag, applied at the rate of 6oz per square yard to the surface soil beneath such trees, as far as the branches extend, will undoubtedly prove advantageous. On lighter soils, superphosphate should be applied early in spring at the rate of 4oz to 6oz per yard, this to be preceded by a dressing of lime or chalk during the autumn, because the "super" makes a great demand on the lime in the soil. The two forms of phosphatic manures are the most economical for ordinary purposes, but when a bone phosphate is preferred, steamed bone flour should be used.

In many gardens where the soil is rich and deep Red Currants often grow far too strongly to be profitable, and I know of some instances in which they have been uprooted because of their

*Raphiolepis ovata.*

unfruitfulness. If, however, they are summer pruned, and dressed with phosphate annually, the strongest growers may be brought into a satisfactory condition. This valuable bush fruit succeeds splendidly in a strong soil where the roots can force their way between the fragments of stones intermixed with earth. Under such conditions the growth made is short-jointed and fruitful, probably owing to the large amount of phosphates such soils contain.—H. D.

*Raphiolepis ovata.*

The Indian Hawthorn blooms in June, and its flowers much resemble a *Crataegus*. The foliage is ovate, stiff, and shining; indeed, very handsome. The genus is Chinese, and not quite hardy with us, though in sheltered gardens *R. ovata* succeeds out of doors. It is well worth a try.

## Trees of the Bible.

(Concluded from n. 492.)

The Poplar, I think, is noticed once or twice, and this is probably the white species; while the Ash, from which idols and graven images were made, was not an ordinary Ash tree—which does not grow in the Holy Land—but either the Pine or what is termed the Manna Ash [which is an Ash.—ED.] Two imported woods referred to on several occasions are the Almug, which was brought in during Solomon's time for building purposes and for manufacturing into musical instruments, and may be assumed to be the Sandal Wood of India; and Ebony, which was a hard wood brought over as merchandise also from India to Tyre.

Few other trees remain to be treated of. Among the remainder, however, we hear of the Chestnut, which is again a misnomer, being the Plane tree, and which grew in some profusion along the banks of the Jordan, the true Chestnut probably not being existent in Palestine, and the Cypress spoken of by Isaiah as a forest tree, and used for idols. It was doubtless a Juniper, which grew round about Lebanon. It was, however, not the same as the Juniper mentioned in another place, which was apparently a kind of Broom, growing in the wilderness about Sinai, and under one of which Elijah is stated to have lain down. Another bush which played a conspicuous part was the Acacia, supposed to represent the burning bush. It was, at any rate, a thorny shrub and very abundant. There is a scant reference or so to the Willow, which was the Babylonian or Weeping Willow, and was met with as its nature demands, as at the present day, by the side of brooks, rivers, and watercourses. Thus Isaiah talks of "springing up as a Willow by the water." The Sycamine, it is thought, was the common Mulberry tree.

We have now—with a passing mention of the Apple (really Apricot), the Pomegranate, and the Nut (that in Song of Solomon being the Walnut, cultivated by the Jews for its fruit)—only to deal with the two highly and extensively cultivated fruit-producing trees, the Fig and the Date. The former was in that country and in those days, a very necessary food, being an article of diurnal consumption both in Palestine and Syria. It was an emblem alike of security and prosperity. To dwell under one's own Fig tree was indeed quite the respectable and correct thing, according to the primitive conditions of the time. It is a curious fruit, having at certain times the produce of two seasons upon its branches at one and the same time.

Lastly and in conclusion, there is the Date Palm, that beautiful and fruitful tree which grows with its feet in the cool, moist earth, and its stately head in the burning sun. "To flourish like the Palm" was apparently an axiom of extreme well being. Its delicate fruit needs, of course, no description here. Its day and generation, however, like so much in that sad and retrograde land, with her bygone history and former prosperous soil, is now but a tale of the past, for however flourishing it was in the time of the Jews, the Palm is now practically extinct in that country.—J. A. CARNEGIE-CHEALES.

## The Price of Flowers.

Some thirty-five years ago a young English doctor went on his honeymoon trip to Switzerland. He and his bride spent their holidays midst the mountain scenery, and they gathered the flowers and Alpine plants from each mountain peak they climbed, as a memento of their sojourn. On the last day of their honeymoon the bride's attention was attracted by a beautiful clump of Alpine Anemone, whose starry blossoms shone conspicuously upon the snow and hoar frost of a rock that formed the summit of the peak they were ascending. Anxious to please his bride, the gentleman scaled the rock, but just as he was in the act of plucking the Anemone the thin crust of earth on which they grew slipped, and he was precipitated into the crevasse of a glacier that yawned on the other side. No one could fall from such a height and live. It was impossible even to recover the body, but the guides told the heart-broken lady that in the process of time the glacier would descend into the valley, and it would then be possible to recover the corpse. A calculation was made (continues the "Daily Express") as to the time the glacier would take to descend, and the bride made her home in the little Alpine village at its foot, and resolved to wait this terrible home-coming of her beloved one. For over thirty long years she waited and watched the slow but inevitable progress of the glacier that was bringing her loved one's body to her. Two years ago her patience was rewarded. The glacier descended as the guides predicted, and crystallised in the ice was found the body of her husband, still clasping the Anemones in his hand. It is safe to say that there is not a single Alpine plant that has not been responsible for some terrible tragedy.

## THE BEE-KEEPER.

### The Age of Worker Bees.

One is frequently asked: How long does a bee live? Not long ago I was driving some bees for an old farmer, who gravely told me he had had those bees thirty years. It is easier to imagine his utter astonishment than to describe it when I informed him that probably there was not a bee of any description that was in the hive the previous summer. It is easy to determine the age that workers will live to, in the summer, in the following manner. If a hive of bees (the common English bee) swarm, take out the queen and replace her by an Italian queen. Closely watch the swarm, and in about five weeks the yellow banded Italian will be seen. Gradually these will increase, and the English decrease, and in about seven and a half weeks the last of the blacks will be seen. This shows that during the height of the season, bees usually live about eight or nine weeks; for the bees, after hatching, generally stay at home and act as nurses for two weeks. As the work in the field decreases, so their lives lengthen; so that those which hatch in August and September live until the next spring.

### Italian Bees.

If any of your readers have not tried Italians they ought to do so. The queens are very fertile, producing thousands of busy and hard working workers that beat the blacks easily. They are more easily handled than our native bees, having excellent tempers. The difficulty in this country is to keep the race pure; so they become very expensive, because mongrels have a dreadful temper which it would be difficult to beat. Pure Italians can be easily distinguished, for round the abdomen they have three bright yellow bands.—HYBLA.

### Colonies Short of Stores.

It repeatedly happens from various causes, such as neglect of feeding at the proper time, that it is absolutely necessary to feed some stocks at a period when it is not advisable to administer liquid food to them. Colonies that have been placed in a position where the sun does not shine upon them refuse to take down the food given them, although this may be as early as September; and other colonies take the food down rapidly. This is accounted for by the stock going into winter quarters earlier through lack of warmth.

There is little or no difficulty in remedying this state of things if stored combs can be removed from stocks which have excess; but if this cannot be done, the difficulty will have to be met by supplying them with what is termed candy. A colony thus saved will be worth all the trouble and attention this process will necessitate. The recipe for candy is as follows:—To 12lb of sugar, add one quart of water, put in a large saucepan—or preserving pan preferred—and place it on the fire, stirring thoroughly until dissolved. Let it boil until the scum arises, which will be very soon, and in order to prevent the syrup boiling over or burning on the bottom of the pan it must be stirred continuously, and skimmed until cleared. As soon as it is perfectly clear add two wineglasses of vinegar, keeping on stirring meanwhile, after which let it boil until sufficient water is evaporated and the bubbles crackle, when it should be removed from the fire and a spot or two dropped from the spoon upon a saucer and allowed to cool. Should it remain sticky or soft it will require boiling again until it sets brittle, when it may be removed from the fire and poured into dishes previously prepared by greasing and allowed to cool in cakes. Cream of tartar may be used in lieu of vinegar if preferred. In this condition the bees will take it down readily, as they require it, without harm. It should however, be placed on the frames under the quilt, above the cluster, the first fine warm day, not in very cold weather, as the disturbance occasioned by opening the hive, &c., in cold weather would excite them, and would consequently be injurious.

Activity during a cold period causes an increased consumption of food, which leaves a residue and overloads the abdomen of the bee, and if the low temperature should continue this will sometimes result in a mild form of dysentery. Any method of feeding during the period of rest is injurious, and should as far as possible be avoided by proper attention at the end of the season. If there is any probability of a stock managing on the stores they possess, it is better to leave the candy until breeding commences, say, about the beginning of February. There is then less risk of any excitement being deleterious, as warm spells are not uncommon, and the extra refuse would be voided before it proved fatal.—E. EATON, Sandbach.

A PIT-MASON DUCHESS.—The following is from the "Chatham News":—"Extraordinary Pear.—Mr. S. Whiddett, of High Street, Rainham, last week picked from a tree in his garden a Pit-Mason Duchess Pear weighing 1lb 10oz."

## Young Gardeners' Domain

The Editor welcomes short letters from under-gardeners. Letters should be confined to 500 words in length, should be written only on one side of the paper, as clearly as possible, with one inch space at both top and bottom, as well as at the sides.

### Christmas Roses (Hellebores).

Few plants have a better claim to a place in the herbaceous borders than the various species of *Helleborus*, especially the old favoured *H. niger*, commonly called Christmas Rose. In a little village of East Kent there is a cottage which has in its humble collection eight crowns of Christmas Rose, and these have been in the same position for twenty years, and annually they send up thirty or more pure-white flowers from each crown. These, I may say, are in a good loam, with a chalk subsoil, and grow on the north side of the cottage. The soil is seldom moved or manured. The flowers of this variety are very useful for small vases, and travel well.—F. H. W., Yorks.

### Freesias.

The *Freesia* seems to be gaining in popularity, and I should like to give to the readers of the Journal, a small note on the culture of these most popular bulbous plants. I have been most successful with them. The best method, I think, is to place the bulbs about half an inch deep, in 5in pots; and the best compost for them is two parts of good loam, one part of leaf soil, and one part of spent manure, with sufficient sand to make the whole open. Place the pots in a cold frame, and cover with a mat or cocoanut-fibre, and when the majority of them are through the soil, the mat should be removed. They can still remain in the frames, as they delight in cold treatment. When the growths are two or three inches high they should be staked, placing four neat sticks round the sides of the pots; but if time can be spared they should be staked singly, as they look much better and neater. They should then be taken into the greenhouse as required. So soon as the flower spikes appear, liquid manure should be given frequently, as this helps to give a better floraison. After passing out of flower, do not allow them to be neglected, but still feed the plants, as this helps to increase the size of the corns for next year's flowering. But so soon as they show signs of ripening, water should be gradually reduced until they are finally dried off. They should then be placed in a sunny position, so as to ripen them well.—H. J., Journeyman.

### Culture of *Stephanotis floribunda*.

The way generally adopted in propagating is by cuttings put in during the winter months from the hardened growths. All that is necessary is to secure pieces of, say, about four joints, which must be cut with a sharp knife to make sure of a perfect callus. Some 4½in pots, neatly drained, and a compost of fibry loam and leaf mould in equal parts, also some coarse silver sand, may be employed. Insert three cuttings in each pot, and dew-over with a fine rose, when the pots may be placed in the cooler part of the stove, only just watering sufficiently to keep the cuttings from shrivelling. As the year turns, the pots may be plunged in a propagating case, when new growths will soon be perceived. If a new stock is now required, no time should be lost in attending to the work, and I prefer stout shoots taken with a heel and about six inches long. When rooted they may be removed into 5in or 5½in pots, using the same compost, and pinch the shoot when about a foot high. This will induce back growths, which, when large enough, ought to be trained separately. The syringe is indispensable if insects appear. As autumn approaches, a rather drier position should be given, also less water, nothing more being required until about the following February. Then it must be determined as to how the plants are to be grown—whether planted out or for pot purposes. In the former case some good sound loam is required, with a little leaf mould, charcoal, coarse silver sand, and good drainage. Many people prefer a mixture of peat, but I have always found a shorter-jointed growth produced and flowers equally fine from the use of the former. The syringe must again be kept going, and the growths evenly trained in a horizontal position on the wires. Avoid an undue shading of the plants below. Water may be given freely, and a little artificial manure top-dressing, or liquid manure, will give a tone to flower and foliage. If grown in pots, 10in will be found a most suitable size for the first season, training each shoot separately to upright pieces of string or very thin wire fastened to the roof, which can be unloosed, and the shoots fastened to the trellis. The same routine may be carried out during the winter. The pinching back of weakly shoots will induce more vigour, and if an eye is kept on the pots as they become filled with roots, and larger ones given, huge plants will soon be the result.—P.

### Fruit Forcing.

**VINES: HOUSES STARTED EARLY IN NOVEMBER.**—Whether Vines are in pots or planted in inside borders the temperature will need to be increased to 60deg at night in mild (55deg in severity) weather after the buds break, gradually increasing it from that stage to 60deg at night when the Vines are in leaf, 65deg by day in severe weather, and 70deg to 75deg in mild weather. Ventilation should be given at 70deg, just a little to insure a change of atmosphere, increasing it with the sun heat, having it rather free at 75deg, and above that temperature, for it is important that the foliage be well formed and solidified. Avoid, however, sharp and drying currents of air, as that cripples the foliage, stunting the growth. Sprinkle the Vines in the afternoon of fine days, and damp the floors twice a day according to external influences, avoiding a saturated atmosphere on the one hand and a dry one on the other. If there be evaporation troughs charge them with liquid manure, the clear drainings of stables and cow byres, but avoid those of pigstyes. Peruvian or ammoniated guano, 1oz to a gallon of water, is suitable for filling the troughs, also for watering Vines in pots or planted out, the liquid being applied at the same temperature as that of the house. Disbudding must not be practised until the bunches show in the points of the shoots, but the Vines should be tied in position as soon as the growth has well commenced, and before the shoots are so long as to be liable to be damaged in the operation.

**LATE HOUSES.**—Take every possible precaution against damp. Drip is fatal to late Grapes, a single drop getting inside a bunch being sufficient to spoil it, as the decay rapidly spreads. Drip is often caused by keeping the house closed and the pipes cold, so that moisture condenses on the glass and falls from the rafters and sash-bars on to the Grapes. This is common where early ventilation is neglected on fine days, the moisture being condensed on the berries. A little air and genial warmth in the pipes dissipate the moisture and prevent decay in the berries, but too much heat and too dry air cause the Grapes to shrivel; seek, therefore, a dry, cool, and equable temperature, 40deg to 45deg being sufficient, keeping the house closed in damp weather, and when clear admit air freely. Remove all leaves as they become ripe, avoiding sweeping, as dust greatly impairs the appearance of the Grapes. Look over the bunches occasionally, and promptly remove any decayed berries.—ST. ALBANS.

### Kitchen Garden.

**RHUBARB FOR FORCING.**—Strong clumps of roots ought now to be dug up from the position where they have been growing. Large roots are very suitable for the purpose, as it is possible to divide them into a portable size, and thus readily transfer them to the forcing house. Any warm place, where the roots can be accommodated so as to admit soil round them will do for forcing. Should the place, in addition to being warm, be also fairly well charged with moisture, it will be an advantage in accelerating the growth and rendering the supply of water less necessary, but in a dry atmosphere surround the roots with soil, which should be kept moist. Hard forcing is not desirable, though until the turn of the year more heat is required than after, to induce the crowns to push. A temperature of 60deg to 65deg need not be superseded. 55deg to 60deg will induce growth, but rather slower, though the stalks will be stronger.

**SEED POTATOES.**—It is as well to select these from the general store and keep them to themselves, or if the selection were made at the time of harvesting look over the tubers now and place in a light position safe from frost. Laying them thinly in shallow boxes is the best of all methods of preservation. Medium sized tubers of good shape are the best.

**CABBAGES.**—The plot containing the plants which have been planted this autumn should be cleared of any accumulation of weeds, and the flat hoe run through the soil. If there are any vacancies in the rows these may be filled up by the introduction of strong plants from the seed bed or nursery bed, lifting them with a ball of soil and roots.

**LETTUCES.**—Plants in the open ground should be cleared of weeds and masses of decaying tree leaves about them, stirring the surface soil also. A light dusting of soot will be beneficial in warding off small slugs. Give the plants under glass plenty of air in favourable weather.

**BROCCOLI.**—Forward plants of winter Broccoli may be lifted and planted in pits or some place where they can be tem-

porarily covered from the effects of heavy damp and stiff frost. Those with heads now three inches or more across are worth preserving.

**CHICORY.**—Strong roots of Chicory will readily force in a temperature of 55deg. Plant a number in deep pots, surrounding with soil, and give a watering. Invert a pot over, and place in a warm cellar. Boxes deep enough to hold the roots will do equally well. Growth must be made, however, in absolute darkness, so that it may be in a properly blanched state, when it is excellent for salads.

**HORSERADISH.**—A portion of the Horseradish quarter should be trenched up, taking out the whole of the roots, both large and small. A selection may then be made from these for culinary use, and planting purposes to form new beds. The thick, strong roots are, of course, the best for use, while the more slender with good crowns attached may be placed on one side for spring planting.

**FORMING MUSHROOM BEDS.**—Manure for Mushroom beds should be fresh horse droppings from which the fiery heat has been expelled; then, in a nice condition as regards moisture, being neither wet nor dry, form into a bed, which may be 3ft or 4ft wide and not less than 6ft long and 1ft deep. Place the manure in layers and make firm. This may be done with the fork or gentle treading with the feet.

**SPAWNING MUSHROOM BEDS.**—Should the manure not be likely to become excessively hot, the spawn may be inserted immediately after the bed is formed. Obtain bricks of healthy spawn, and break into pieces the size of walnuts or rather larger. Place these firmly in the manure about an inch below the surface. Then surface with an inch of good, fresh, loamy soil; beat firm and level, and smooth with the back of the spade. The surface of the bed should be covered with a layer of hay, and a temperature of 50deg maintained in the structure.—EAST KENT.

## Weather Notes.

### Weather in Perthshire.

Frosts varying from 2deg to 9deg have been intermittent during all the past month, but not till the 26th ult. did winter appear to settle down upon us. On the 27th snow was general over the country, from 2in to 5in being reported. All the hills are still covered in a greater or less degree. The partial thaw that occurred on the 28th was followed by 5deg of frost on Sunday morning, and 13deg were registered on the 30th. On Monday everything looked like a continued spell of wintry weather.—B D., S. Perthshire.

### Temple House Gardens, Great Marlow, Bucks.

The rainfall here for November, 1903, was 1.93; the maximum temperature 55deg on the 9th, and the minimum 24deg on the 19th. There were 8 foggy mornings, viz., on the 4th, 5th, 6th, 7th, 8th, 9th, and 15th, and a foggy day with misty rain on the 11th. The maximum temperature for November, 1902, was 58deg on the 12th, and the minimum 24deg on the 20th. The rainfall for November, 1902, was 2.15in. The river Thames is rising rapidly again.—G. G., December 1.

### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

The weather for the past week has been dull and wet.

\*\* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**SCHEDULE RECEIVED (H. A. A.).**—We thank you for the schedule of the Aberystwith Show.

**APPLE TREES CANKERED (J. H.).**—We are obliged by your letter and enclosures, which shall have our attention. The question for you to determine is this, Are the insects the cause of the canker or the result of it? This you can determine by experiment. Your theory is not new. As regards hundreds of trees and thousands of cases of canker that we have examined, we indicated the cause to be a fungoid infestation.

**BOOK ON HEATING (A. L.).**—You will find the book on "Heating by Hot Water," by Walter Jones, which has ninety-six illustrations, and the second edition of which was published in 1894 by Crosby, Lockwood and Son, 7, Stationers' Hall Court, Ludgate Hill, London, a useful book. The price is 2s. 6d. net.

**CYPRIPEDIUM LEAF INJURED (L. T. K.).**—Two causes may have contributed to the rusty appearance of the foliage—first, the employment of water containing some injurious substance, and placing the plants in too low a temperature. The former is probably the chief cause, as the injury seems to be confined to the lower portions of the leaf where the water would accumulate in the axils. Rain water is the best, and very little will be needed on the foliage at this time of year. The temperature should not be less than 55deg, and a shady position is preferable for most Cypripediums, as for other Orchids which do not possess pseudo-bulbs.

**CULTURE OF HELLEBORES (H. T. H.).**—A deep, fertile, rather strong, yet porous soil is enjoyed by these plants, and a position shaded from the mid-day sun. For choice we prefer a border that is shaded by a wall or distant trees at mid-day. It is important, too, that the roots be not spread out near the surface, but as far as possible they should be made to point directly downwards, the same as Carrots. This hint we had from a person who grew these in plants by the acre and sold the flowers in thousands. In growing the plants in pots, place them in a compost of good loam with a little decayed manure and wood ashes added. Plunge the pots over their rims in a partially shaded position in your garden, and water the plants liberally during dry weather, giving them weak liquid manure occasionally when they are in full growth. The morning sun and afternoon shade appear to suit them admirably. The foliage should be well sprinkled, and the ground surrounding the plants be made moist during the evenings of sultry days in summer. A good time for dividing and planting is immediately after flowering.

**GLADIOLUS DISEASED (S. R., Brummagem).**—The leaves are infected by a species of Heterosporium, probably *H. gracile*, though the fruits are not very distinct, the black mould not being yet fully developed, and the corms are slightly affected by a fungus which forms black crustaceous patches on the outer sheaths, and the hyphae gradually extending to every part. It is called the bulb scab (*Mystrosporium adustum*). The corms also swarm with black slugs, these probably accounting for the destruction of the tender roots, and to some extent for the dying back of the foliage and very indifferent formation of the young corms.

Probably the wet weather has favoured the fungi and certainly the slugs. The ground should be given a good dressing of quicklime, slaked with the smallest quantity of water necessary to cause it to fall into an apparently dry powder, and the plants may be sprayed with ammoniacal carbonate of copper solution. The season, however, is so far advanced that there is little prospect of the plants forming good corms. The tops should be burned when died down, and the worst or dead parts now cut off and destroyed by fire. Before planting the corms, they, when only slightly attacked by the scab, should be soaked for two hours in a solution of one part formalin to three hundred parts water, so as to destroy the fungus before it enters the deeper parts of the corm. The thing, however, is to get rid of the slugs, as there can be no good root formation whilst these pests exist. The dressings of lime should be repeated occasionally.

**MOVING RHODODENDRONS (J. N., Meath).**—No shrubs transplant better than these, and they may be had from a nursery any time from October until the buds commence swelling in the spring. They may be dispatched safely at this season of the year, provided the roots are kept quite moist in transit.

**SEVENTY-FOUR DESSERT PEARS ON THE QUINCE (Alpha).**—Doyenné d'Été (d.g.), Beurré Giffard, Jargonelle (d.g.), Souvenir du Congrès (d.g.), Clapp's Favourite (d.g.), Petite Marguerite, Williams' Bon Chrétien, Buerré d'Amanlis, Madame Treyve, Triomphe de Vienne (d.g.), Beurré Superfin, Fondante d'Automne, Marguerite Marrillat, Beurré Martillet (d.g.), Beurré Hardy, Conference, Louise Bonne of Jersey, Gansel's Bergamot (d.g.), Magnate, Beurré d'Avalon, Beurré Alexandre, Lucas, Belle Julie, Directeur Hardy, Thompson's (d.g.), Seckle (d.g.), Comte de Lamy (d.g.), Pitmaston Duchess, Brown Beurré (d.g.), Doyenné Boussoch, Marie Louise (d.g.), Marie Louise d'Uccle, Beurré Fouqueray, Président d'Osmonville, Emile d'Heyst, Beurré Bosc (d.g.), Baronne de Mello, Durondeau, Beurré Jean Van Geert, Conseiller de la Cour, Comte de Flandre (d.g.), Princess, Fondante Thriot, Duchess d'Angoulême, Hacon's Incomparable, Beurré Baltet Père, Doyenné du Comice, Knight's Monarch (d.g.), Crasanne (d.g.), Van Mons Léon Leclerc (d.g.), Buerré Diel, Forelle (d.g.), Huyshe's Prince Consort, Huyshe's Prince of Wales (d.g.), Doyenné Defays, Buerré Berkman's (d.g.), Beurré Bachelier, Winter Nelis, Beurré d'Arenberg, Glou Morceau, Bergamotte Dussart, Beurré d'Anjou, Passe Colmar, Président Barrabie, Beurré de Jonghe, Jean de Witte (d.g.), Josephine de Malines (d.g.), Easter Beurré Nouvelle Fulvie, Marie Benoist (d.g.), Olivier de Serres, Passe Crasanne (d.g.), Beurré Rance (d.g.), Bergamot Esperen. The letters d.g. are for double-grafted on the Quince. The trees should be planted 2ft apart for single diagonal cordons, and be trained at an angle of 45deg. The best aspect for Pears is west. We have, however, found them succeed well against walls with east, and even south, aspects.

**DEPRESSING VINE RODS (F. J.).**—It is not "always" necessary to depress Vine rods to secure an even break. We have Vines, not forced, that have not been "depressed" for twenty years, and the rods in the great vinery at Chiswick remain trained up to the roof constantly. When Vines are forced into growth early they generally break more regularly when trained horizontally for a time. The sap has a natural tendency to move directly upwards, hence the disposition of the buds near the top of a Vine to start first, and this is further induced by the house in which they are trained being warmer at the top than at the base of the rafters in the absence of special care in ventilation. The branches of trees on walls are more or less depressed except in the case of vertical cordons, and these, as a rule, are not so well furnished with healthy spurs at the base as nearer the top, the growth of diagonal cordons being more uniform from base to summit because of the depression. The buds at the base of your Raspberry canes that are trained upright to stakes do not push so quickly, grow so strongly, nor bear such fine fruit as those near the top of the canes; and similarly, if your Roses make strong shoots, 4ft or more long in the summer, and these are neither depressed nor shortened, many of the lower buds will remain dormant; but if you peg the long shoots down the bursting of the buds will be far more uniform. If your Vines break regularly without bending down the rods let them alone; but if they start at the top first, the lower buds remaining dormant, you will find the advantage of depression.

**RIVER BANKS BROKEN DOWN.**—The following query and reply we cull from the "N.B. Agriculturist": I have about fifty acres protected by embankment from the river, but the embankment is in considerable danger of being broken at the upper end, and in that case the whole fifty acres will be under water. I have several times advised the proprietor of the danger, but it looks as if nothing is to be done; and, as failing this, the river will undoubtedly break in this winter, I would like to know what my position would then be. Sixty acres of land would be lost, and, I presume, I would be entitled to reduction of rent; but how would I stand in regard to the manures and seeds I have put into the sixty acres? I have broken up and renewed the most of this, and sown down in Timothy. Being heavy land, my work, which has been considerable, besides my outlay, would be lost. Your advice in the matter will be much appreciated. Can I compel proprietor to carry out such work as would ensure safety of embankment? I presume not.—HUNTER. [You cannot compel the proprietor to take due measures for the protection of the embankment, but in the event of the river breaking its banks and rendering useless the sixty acres of haugh land referred to, you would be entitled to withhold the rent of said land, on the ground that you had been deprived of the proper use of part of the subject let to you. The serious damage caused last year by flooding and the bursting of river embankments has led the tenants of river-side lands to realise the necessity of securing in their leases better provision for their protection against such damage.]

**"TUBERS" ON CUCUMBER PLANT ROOTS (C. S.).**—The swellings on the roots and root-stem are caused by eelworm, evidently the root-knot eelworm (*Heterodera radicola*). A fuller reply will be given next week.

**STORING CACTUS DAHLIA ROOTS FOR THE WINTER (R. B.).**—The proper procedure is to allow the roots to remain in the ground until the tops are destroyed by frost, when they should be cut down to within 6in of the ground, and afterwards lifted. Remove as much soil as possible with a pointed stick, not damaging the fleshy, tuber-like roots, attach the label of each to the stem, and store away in a cool, frost-proof, rather dry place. Looking over occasionally to remove any part of the roots that may be damping, is all that is required until starting or planting again in the following spring. The roots you have taken up and placed in a box will keep sound enough exposed if the place they are placed in is not very dry, say a cellar; but if the storing place is very arid, the roots are better covered with rather dry soil, yet keeping the collar or base of the stem clear, where the eyes or buds are that will start into growth at the proper time, only just covering the fleshy roots. This prevents excessive evaporation and the shrivelling of the fleshy roots. The cooler the roots are kept the better, only frost must be excluded.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.*—(Clues).—In its present condition, and without some information about it, we do not recognise the specimen. (A. F.).—1, *Peristrophe speciosa*; 2, *Erica gracilis*; 3, *Pelargonium tomentosum*.

## General Buildings of the Farm.

Since the days of Mr. Pecksniff, the world has seen architects of all sorts and kinds, and although some may be termed cosmopolitan, there are others who take up distinct lines and follow them out. For instance, we do not suppose that the great ecclesiastical architects of the day would care to trouble themselves much with municipal buildings, or the design for a railway station. If they condescend to a school (National Society), a church institute, or a vicarage, that is about all the digression they make; and of course they are justified in so doing; every man to his trade. In like manner the designer of Queen Anne or Georgian dwelling-houses, has a mind above anything so homely as stables or cow sheds, and if he did undertake such work, it is quite possible the buildings erected would not be very suitable to the purpose for which they were needed.

It is supposed that land agents, stewards, and the like have a workable knowledge of the requirements in the way of buildings for the several estates or farms under their management. As young men, they are expected to take a short period of training in some architect's office to get the requisite knowledge of measurements, dimensions, and costs; that is, cost of raw material and of skilled labour for erection. A good many of these men are poorly equipped for their work, or at least we must suppose so, for we have seen money wasted in large sums upon unnecessary, incommensurate, and ill-adapted buildings; and again we have seen a poor farmer absolutely without proper shelter for stock, or his manifold implements, which rapidly deteriorate when left exposed to the elements.

In the first instance, where too much money has been spent "not wisely, but too well," the landlord is crippled at the time, and constantly has a feud in course of time with "repairs," which he either leaves undone, or does with much grumbling in a very perfunctory manner; and the "smart" buildings in time get a very unkempt, neglected look. We remember a model farm standing where some of the doors were made wide enough to admit of a man with a forkful of straw on his back, and where, over the draught horse stables, were "chambers," braided and furnished in a far better style than the bedrooms of the cottages on the same farm. Our opinion is that an intelligent farmer is a far better hand at planning farm buildings than any professional. He will contrive them so as to have a maximum of shelter and a minimum of work. It is merely a matter of arrangement; and we will warrant he does not spend much money.

We hear about farms in a ring "fence." Before beginning to build, the site should be carefully considered. A good water supply is the first desideratum, not only for the house, but also for the yards; for much expense may be quickly entailed if a special water supply has to be arranged for. The buildings should be easy of access, near or upon a good, well-metalled public road. (We have not much faith in the farmer as a road-maker; it is one of the things that is always put off till a more convenient season—which never comes). There is enough labour on a farm without increasing it by road-making, which requires heavy draught; and here, in passing, we would just say how well these motor cultivators get over some, or many, of the occupation roads, especially on strong, land farms. They will have to be specially constructed: big, heavy, very strong, and thus in a measure they will defeat their own ends.

The soil for the site should be dry, easy of drainage, with a slope to the south. Warmth is one of the first desiderata, and hence all yards where cattle are kept should get as much sun as possible. If the yards are covered (which we hope is the case on most farms now) the southern side may well be left open. Yards covered with wooden roofs are by no means expensive, while as to their value—well, nobody but a poor farmer who has struggled on for years before getting one, can tell.

We sometimes wish the cattle could give us their experience. To lie warm and dry is half the battle; nothing does well in cold, sodden yards, for so much food is used up in supplying bodily heat before any can be apportioned for feeding purposes. On every farm there should be a goodly supply of loose boxes. This, especially, should there be no covered yard. Any animal requiring extra care or extra food will be enabled to have this if put up into a loose box. Indeed, it is difficult to know how they can well be dispensed with. Cows at calving time, mares and foals, young stock, ailing stock—for these, nothing beats a loose box. A loose box affords a certain amount of exercise, and we ourselves know the comfort of being able to lie, stand, or sit as we list.

We have often referred to the value of straw; and for storing straw, either fresh from the machine or chaffed, there is no place like the big, wide old barns that our forefathers affected. We don't need them now for threshing purposes; the days of the flail are over; but they do conduce to the careful saving of fodder. At one end of the barn will most probably be found the pulper, so that rations of chaffed straw and reduced roots can be easily mixed. In all cases it is well to consider the convenience of the yard man. He should have his stores of food and bedding handy. Winter days are short, and he has a good bit of work to put in between sun and sun. No, that will hardly do, for much of his work is done by lantern light. Where a large dairy herd is kept, any system that facilitates a regular and good water supply is most essential.

As cows yield so much better when warmly housed, it is not a bad plan to have the granary over the cow-house; thus a double purpose is effected. The warmth from the cows will assist materially in getting and keeping grain in good condition. Heat rises, and it is wonderful how much heat cows will generate. Warmth is necessary for stock, but ventilation is even more so. It is so difficult to steer clear of the two extremes, but it has to be done, if buildings are to be sanitary and wholesome.

Anyone who has had to do with pigs will know what restless, tiresome animals they are. They are never contented unless they can root up the floor of their abode, and being strong they are usually most successful in their efforts. One part of the sty should present, if possible, an even surface, and nothing makes better flooring than old railway sleepers set on edge. These are strong and long: they are heavy; and well packed in it will require a particularly clever and energetic pig to up-root them. Concrete floors for pig-sties are of little use. They soon become broken somewhere. A weak place shows, and then it is merely a question of time. There is nothing more difficult to keep in order than the causeway running along boxes or sheds opening into a yard where pigs lie; and have it up, sooner or later, they will. The cost of sleepers is about two shillings each.

Never forget the value of light. So often we find it blocked out, as though it were a deadly ill instead of being the greatest gift of God. A well-lighted building shows up dirt, and awakens a feeling of shame, or should do so, in the attendant. At any rate, it is more easy to remove dirt seen than unseen. It is quite possible to be over-burdened with buildings, but this is not often the complaint.

A few farms have Dutch barns attached. What a saving of labour and expense it would be if they were general! Covered yards and Dutch barns would do more to help farmers in their

difficulties than motor power, wonderful and useful as that promises to be.

On farms that lie wide, it is imperative to have sheds and yards out in some of the far distant fields, and here again railway sleepers come in very useful, and at the same time they are inexpensive. There is no need for anything very elaborate: shelter and a place where some straw can be turned into manure, and this in proximity to arable fields that need it—that is all.

We should like to add a few words as to the construction of the foreman's house, especially that, where farm servants are boarded. Whatever else is done or undone, there should be a great, good, and well-warmed kitchen to serve for meals and also as a cheerful sitting-room in the evenings. Scores of lads turn out into the streets because there is not adequate room for them and the foreman's family in the small apartment designed by the architect, who is hardly up to the requirements of the case. The men's bedchamber should be equally large and airy, with a separate staircase, and there should be at least one small room that might serve in cases of sickness.

### Work on the Home Farm.

After writing in a doleful strain for weeks, it is pleasant to chronicle something satisfactory. Up to the time of writing there has been no rain for more than a week, but drying winds instead, and we, as well as our neighbours, were able to plough again, and what is more, make really good work. It is a curious fact that the most satisfactory work is performed by ploughing a fair depth. The top 3 in or 4 in only represent the mud; the lower strata are comparatively dry. After being ploughed and allowed a day or two to dry, an excellent seed-bed is obtained. Some Wheat is being ploughed in, but a good portion is drilled, and the shortage in the 1904 Wheat acreage will not be so very serious after all.

We are sorry to say that the persistent way in which the farmers of this part (Hull) have threshed Barley, combined with the very excellent yield, have quite overdone our markets. The trade has had more Barley than it could digest, and forced sales are now made at considerable sacrifice. We must give our customers a rest. We hear a good deal now about heated lots, and fear we may hear more before spring. We shall have to be very careful in purchasing seed parcels.

Until now there has been no time to think of planting out August-sown Cabbages. The time is very late, but if the weather should keep mild and dry a little longer, the planting might yet be done. Finer crops may certainly be grown by autumn than by spring planting, though where rabbits and hares are numerous the plants are more easily protected from them in the restricted space of a seed-bed during the winter. The finer weather has postponed the manuring of seeds, but it is work that can wait.

Good beef is decidedly dearer, and store cattle firmer in price. Sheep also are very firm. What a demand for both there would have been if farmers had been flush of money! We are glad to see that the scarcity of that article is being recognised by wholesale remissions or postponements of rent in many quarters. Both cattle and sheep are doing well. A serious question to many sufferers by bad harvest weather is that of buying cakes or similar foods when they have so much unsaleable grain on hand. The situation has already had a depressing effect on the cake market, and it will be worse if farmers choose to use barleymeal as a cheap substitute. We question the wisdom of using Barley for sheep unless it is cheaper than cake. Barleymeal for cattle is a different matter, and in case of a permanent or secure tenancy we would certainly make free use of it.

---

WEBB AND SONS' STAND AT THE BIRMINGHAM CATTLE SHOW.—Messrs. Webb and Sons, the King's seedsmen, Wordsley, Stourbridge, occupied a position in the show, and made a most imposing display of Swedes, Mangolds, Turnips, &c., worthy of their reputation. The specimens shown are selected mostly from the crops which have secured champion honours in the principal open competitions of the kingdom, including the recent great London Dairy Show, where most important prizes for roots were awarded to the produce of Webbs' seeds, viz.: 1st prize, Webbs' Imperial Swede, 61 entries; 1st, 2nd, and 3rd prizes, Webbs' Mammoth Long Red Mangold, 12 entries; 1st prize, Webbs' Smithfield Yellow Globe Mangold, 37 entries. Webbs' seeds invariably prove successful in the principal open competitions, amongst a few of their latest successes being six 1st and other prizes at London, 31 1st and other prizes at Cardiff (including the special champion prize), 10 1st and other prizes at Norwich, 33 1st and other prizes at Liverpool, 27 1st and other prizes at Cheltenham, 11 1st and other prizes at Gloucester, and many valuable 1st and other prizes, medals, &c., at the Brewers' Exhibition, London, held last October. At Birmingham the produce of Webbs' seeds secured the majority of the honours, viz., 22 1st and other prizes.

## PLANTING SEASON

## PAULS' ROYAL NURSERIES

WALTHAM CROSS, HERTS.

12 miles from London. South Entrance four minutes' walk from Waltham Cross Station; West Entrance three minutes' walk from Theobald's Grove; both Stations on the Great Eastern Railway.

## SPECIALITIES:

**ROSES** in all forms, from open ground and in pots. Gold Medals in 1903 from Royal Horticultural and Royal Botanic Societies.

**FRUIT TREES** for the Orchard, Garden, and Forcing House. Hogg Memorial Medal, 1901.

**HARDY TREES** for Streets, Parks, and General Planting. Silver Medal from Royal Agricultural Society of England.

**SHRUBS**, both Evergreen and Deciduous.

**CLIMBING PLANTS**, Hardy and Greenhouse.

**RHODODENDRONS, CAMELLIAS, & AZALEAS.**

**HERBACEOUS PLANTS** in great variety.

**BULBS and SEEDS**, and all Garden Sundries.

PRICE LISTS ON APPLICATION. INSPECTION INVITED. Upwards of 1000 Medals, Prizes, and other Awards at leading Exhibitions during the past 42 years.

SOLE POSTAL ADDRESS—

**WM. PAUL & SON,**  
WALTHAM CROSS, HERTS.

Rose Growers by Appointment to His Majesty the King.

## BORDER CARNATIONS.

STRONG HARDY PLANTS TO OFFER. The following 12 choice varieties, 6/-; 2 dozen, 11/-; 4 dozen, 20/-; carriage paid for cash:—Pink Beauty, Hon. Adele Hamilton (rose pink), Keith (white), Miss A. Campbell (yellow), Jim Highgate (crimson), Peggie (fancy), Polly Aitken (light-pink), Jessie Stevenson (scarlet), Snowball (white), Bethia Campbell (deep rose), Mrs. Collins Wood (terra cotta), Duchess of Fife (clear rose). Priced List of over 200 varieties free on application.—**M. CAMPBELL & SONS**, Nurserymen, High Blantyre, N.B.

## GRAPE VINES in POTS

Extra Strong Fruiting and Planting Canes  
in all Leading Varieties.

## FIGS IN POTS

All Leading Sorts.

Bushes and Fan-trained for Walls.

DICKSONS Nurseries CHESTER

## 1500,000 BULBS.

Spanish Iris, Yellow, White, and Blue 7/6 per 1000.  
Crocus, all colors 5/6 per 1000.  
Sir Watkin Narcissus 5/6 per 100.  
Horsefieldii 5/6 per 100.  
Trumpet Narcissus 7/6 per 1000.  
Glory of Leiden Narcissus 6d. each.  
Madam de Graaff 3/6 each.  
Sweet Scented Pheasant Eye Narcissus 5/6 & 7/6 per 1000.  
Mixed Narcissus 5/6 per 1000.  
Double Daffodils 5/6 & 10/6 per 1000.  
Tulips, Mixed (choice) 2/6 per 100.  
Single Lent Lilies 3/6 per 1000.  
Snowdrops 5/6 & 7/6 per 1000.  
Strawberry Plants 1/6 per 100.

SEND FOR LISTS BEFORE ORDERING ELSEWHERE.

Cross &amp; Son, Nurseries, Wisbech.

## CLIBRANS

## HARDY FRUIT.

WE make a speciality of the cultivation of trees and bushes for fruit production. Our soil and situation is favourable to the development of well-matured growth and an abundance of healthy roots.

**APPLES**, in choice variety, Standards and Pyramids, 1/6 to 3/6 each; 15/- to 43/- per dozen. Dwarf, Horizontal, and Fan-trained, 2/6 to 5/- each. Cordons, 1/6 to 2/6.

**PEARS**, all the best varieties, Standards and Pyramids, 1/6 to 3/6 each; 18/- to 36/- per dozen. Dwarf, Horizontal, and Fan-trained, 2/6 to 5/- each. Cordons, 1/6 to 3/6 each.

**PLUMS**, all good fruiting sorts, Standards and pyramids, 1/6 to 3/6 each. Dwarf, Fan-trained, 2/6 to 5/- each.

**APRICOTS**, splendid plants, in superb health, Dwarf-trained, 5/- and 7/6 each. Standard and half-standard trained, 7/6 to 15/- each.

**BLACKBERRIES**, 6d. to 9d. each; 4/6 to 8/- per dozen.

**CHERRIES**, in fine variety, Pyramid and Standard, 1/6 to 3/6. Dwarf Fan-trained, 2/6 to 5/- each.

**CURRENTS**, Red, Black, and White-fruited varieties, in choice sorts, 2/6 to 4/6 per dozen.

**GOOSEBERRIES**, fine fruiting varieties, 2/6 to 6/- per dozen.

**LOGANBERRY**, strong plants, 1/6 each; 12/- per dozen.

**MEDLARS**, Pyramids and Standards, 2/6 and 3/6 each.

**NECTARINES and PEACHES**, grand plants, in splendid condition, Dwarf Fan trained 5/- to 10/6 each. Standard and Half-standard trained, 7/6 to 15/- each.

**RASPBERRIES**, strong, well-rooted canes, in variety, 2/6 and 3/6 per dozen.

**STRAWBERRIES**, Prepared Runners from Open Ground, 3/- per 100. Runners in pots, 12/6 p r 100. Extra strong, in 5in. pots, 4/- and 6/- per dozen.

SEND FOR LIST.

## SELECT ROSES.

OUR ROSES, grown in a cool northern climate, invariably give the utmost satisfaction to purchasers. We make Rose-growing a special feature.

**Dwarf Hybrid Perpetuals**, in choice variety, 6/- to 9/- per doz., 40/- to 65/- per 100. Extra strong, in pots for forcing, 1/6 to 3/6 each, 15/- to 36/- per doz.

**Moss Roses**, in lovely variety, 6/- per doz., 45/- per 100.

**Teas and Hybrid Teas**, in choice and beautiful sorts, 10/- to 12/- per doz. In pots, 15/- per doz.

**Noisettes**, in finest variety, 10/- and 12/- per doz.

**China Roses**, in select sorts, 6/- to 12/- per doz.

**Polyantha Roses**, from 9/- per doz.

**China and Bourbon Hybrids**, in fine variety, 6/- doz.

**Climbing Roses**, in fine variety, 9/- to 12/- per doz.

**Penzance Briars**, a comparatively new, but very beautiful class of Rose, 9/- to 15/- per doz.

Above prices are for our selection only, and are carriage paid to customers' nearest railway station.

## ROSES IN POTS.

We have a very special line in T. and H.T. Roses in 7in. pots, with shoots 8 to 12ft. in length; strong, healthy, and well-ripened, at 2/6, 3/6 and 5/- each.

## FORCING ROOTS.

**RHUBARB**, the best sorts—

Strong roots .. 6/- and 9/- per doz

Extra large and strong roots

for forcing .. 12/- and 18/- per doz

**SEAKALE**, for planting .. 7/6 per 100

Extra strong for forcing .. 16/- per 100

Extra-extra strong for forcing .. 21/- per 100

**ASPARAGUS**, for planting .. 3/6 and 5/- per 100

Strong planting .. 7/6 and 10/6 p r 10

Extra strong for forcing .. 15/- and 17/6 per 100

A COMPLETE LIST of all the Choicest Trees, Shrubs, Conifers, Roses, Climbing Plants, &c., is contained in

## Journal of Horticulture.

THURSDAY, DECEMBER 10, 1903.

## The Value of Herbaceous Plants.

THE more we see of gardens, large or small, the more we are impressed with the great worth of herbaceous plants for beautifying beds, borders and shrubberies as compared to a sole use of the ordinary summer flowering subjects, such as Pelargoniums, Calceolarias, Stocks, and various foliage plants.

It is also astounding to see how little these valuable subjects are utilised in gardens of great area. Even when an attempt at employment is made, we cannot but conclude, from the results seen, that those in charge are lamentably ignorant of the variety and extent of this section at command, and at an extremely low rate of value.

There is not the slightest excuse in these days of low prices, when hardy plants can be purchased quite cheaply, for the miserable collections one sees in gardens in every county. When will gardeners generally wake up to the value of these plants, and to a sensible method of growing them? It is to be feared that the scarcity of hardy plants is more due to a want of knowledge, not only of their use, but of the actual variety at command.

So many gardeners are so wrapped up in plants that require glass protection that the difficulty is to get them to think of anything else. We do not intend here to give a list of plants available at various seasons of the year, although it is necessary. Our aim is rather to draw the attention of prominent gardeners to their lack of employment of these useful subjects. Of course we are met with the argument that we cannot grow hardy plants: we want flower at a particular season, say during August, September, and October, and to do this we must grow many annuals. Granted that annuals, employed judiciously, do give a wealth of flowers, yet hardy plants, if properly selected,

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

give equal floral results and have more varied growth, and certainly entail less labour. For instance, what annual can give equal results with herbaceous Phloxes properly selected and cultivated? Yet how often do we see, in nine out of every ten gardens of pretension, more than half a dozen miserably cultivated examples, whereas quite two dozen varieties, covering a wide range of colour and height, would make an interesting display, and certainly would give the blaze of colour required—bright or subdued.

Take, again, the family of Rudbeckias for September and October flowering. R. Newmani as a dwarf plant cannot be excelled for freedom of flower and an effective colour as well. Then we have such varieties as R. nitida, R. Golden Glow, from 6 feet to 7 feet in height if required; R. maxima, with its glaucous foliage, and the pale tinted form of R. pinnata, not forgetting R. fulgida, which flowers quite late in the autumn, not forgetting the simple forms. Helianthus also provide us with great variety in double and single flowers of varying heights, and certainly this is a free-flowering family. Tritomas give a wealth of colour which all admire. The variety in colour covers so wide a range that the wonder is that more are not grown.

For September and October employment what plant can equal Michaelmas Daisies? These, carefully selected, harmonise well with other subjects. Someone says "Oh, but Asters take up so much space." Not at all; a single growth taken off a desirable variety in March, or even April, will grow into a handsome plant for the purpose named if the right sorts are selected. If, however, we grow only the older fashioned, stiff-growing sorts with no side growths, but a cluster of flower at the apex, then certainly these plants are not suitable; but when we have a wealth of variety such as is evidenced in such as The Hon. Edith Gibbs, or many more of Mr. Beckett's seedlings, which grow into handsome specimens in one season all from one stem, the conditions are quite altered.

Pentstemons, although they do not strictly come under the heading of hardy plants, are not nearly enough recognised. No plant will give such a wealth of flower from early July until November, and quite irrespective of the weather. Even in such a year as the present the Pentstemons are quite unaffected. There they were, a mass of flowers, and with a minimum of care expended. The range of colour, form and habit, too, is quite under control with the extensive variety at hand; those who grow the small flowered sorts have but themselves to blame.—E. MOLYNEUX.

## Vegetable Pathogene.

### Eelworm in Cucumbers.

In reply to "C. S." the Stem Eelworm (*Tylenchus devastatrix*), and the Root-stem Eelworm (*T. obtusus*), both produce knots in the roots and swellings on the root-stems. Whether *Heterodera* or *Tylenchus*, they, in egg and young, or so-called larval stage (not distinguishable) pass into the soil or surrounding material, and, unless reached and destroyed, are almost sure to attack the follow-on plants. Every particle of soil, therefore, should be cleared out, and the beds and walls drenched with a 1 per cent. solution of formaldehyde (1lb formaldehyde to 10 gallons of water), which will certainly kill every nematode reached.

It is a good plan to sprinkle the whole of the house before commencing to take out the diseased plants, and remove the old soil with the formaldehyde solution, so that any vermatodes falling on the floor or other parts may receive quietus, and after all is cleared out drench the beds, walls, and floors. The plants removed should be burned; or, better, be at once immersed in the formaldehyde solution as carefully taken from the soil; while the soil removed should be placed in an arca large enough to hold it, about a foot thick, that has been sprinkled with the formaldehyde solution, and the soil ought to be at once treated with the solution all over, applying by means of a rose watering can.

In the course of a few weeks the house may again be used for growing Cucumbers. If the solution has reached all the larval eelworms there will not be any recurrence, only care is taken not to introduce them in the soil. This is best effected by the good old plan of stacking the turves forming the staple of Cucumber compost for a time until the herbage and roots are destroyed, not allowing any vegetation to exist on the stacked turves. If the turf must be used recently cut, it should be heated or steamed, not over 212deg and preferably not more than to 180deg, a temperature of 125deg sufficing to kill eelworms. Or spread thinly and water with the formaldehyde solution, and in the course of a month or six weeks the turf may be used for

the Cucumbers without prejudice, meanwhile turning once a week. The bottom heat has nothing to do with the eelworm, certainly not cause of the "tubers" on the roots. The eelworm is the sole cause, and has been either introduced in the soil or by some other agency.—G. A.

## National Economics.

There are about 230,000 acres reputed under top fruit in these islands. Now, what it behoves us to do is to cultivate the odd thirty thousand acres and lay the axe to the roots of the mostly worthless remainder. Then we should replant with bush grown Apple trees on newly selected, good climatic sites, such as may be in actual occupation, say one thousand acres out of every thirty thousand. Endless acres of the latter go begging for want of the national recognition of the true needs of fruit growing, which should be adapted to the climate.

How very different would have been the issue for the nation had a leader like Gladstone possessed a smattering of natural sciences instead of a perfunctory Greek erudition on which his vastly greater contemporary—our unapproached and, alas! unappreciated Huxley—so strenuously endeavoured to fix the nation's mind! His endeavour was defeated against its own deepest material interest by the greater national tribute uncritically bestowed and laid lavishly at the feet of an incomprehensible Gladstone, who, in turn, comprehended not this nation's destiny. Had the latter had any true communion with Nature, had he only studied Nature, our great mother Nature, on Sundays when all profane literature was banished from his surroundings, how differently would Great Britain be situated actually. Beyond jam-factories, I am not aware of any practicable proposals on his part in the whole of the interests of the organic kingdom.

Thus it was ordained by the nation's own short-sighted choice, that alone the inorganic kingdom should reign supreme; our mineral resources wastefully exploited to the utter discomfiture of the infinitely greater organic kingdom, capable of adequately producing our staff of life. Judicious legislation could transform our pseudo-cultivation into a thing of life, and enable us to assert our greater national independence by means of it.

One million sterling annually, to the true practical and sympathetic education of the farmer, or, rather, the farmer's son, during all those years of two full generations that the inertia of ignorance was thrown into one scale, the inorganic would have paid the British nation magnificently. Such education should have begun in the very year of the repeal of the Corn Laws. Yet a challenge was recklessly thrown to the world to do its worst, and was accepted. The effects have become relentlessly manifest.

The clear reasoning powers possessed by the British nation, and manifested on emergencies, should, at this hour, be concentrated on a struggle for that pre-eminence which seems to be fading away. An inquiry as to what are our national needs and what form to give them finds the latter confusingly interpreted (largely for purposes outside their true bearing). Lord Rosebery referred to the problem quite lately, but whether he stands on the adequately advanced threshold was not apparent. Huxley is the man to advise us: natural sciences and Nature—the study of these is needed, for from them all the rest depends. The need for more intense cultivation of every acre in these islands appeals forcibly to our common sense. Intense cultivation, supported by adequate fiscal and economic legislation, is the true bedrock on which to build up and conserve what past inattention has jeopardised. The absence of any truly national economic newspaper causes me to attempt to open up the subject for editorial treatment and discussion in your columns, especially as your weekly column on "The Home Farm," which I usually read with much interest, points the way to the suggestion being naturally evolved. The most paying crop from every acre in these islands is to be insured literally from our watersheds to the seashore, and why exclude the farming of the sea itself, seeing that the State has amalgamated the Departments of Agriculture and Fisheries? This amalgamation dates from the time of the lamented late Mr. Hanbury.

Intense cultivation of the soil is the province of the gardener, the market gardener, and the fruit grower; and their spirit should be assimilated by our agriculturists, who are, in these precious little Isles, the only adequate solution of the question of the "Food Supply in War Time."

When once the duty of our Government in this direction will have been recognised, and legislative enactments are promoted which directly aid the development of that highest cultivation, and which in its final issues a generation hence will provide our first line of defence, revolution in British thought will be recorded.

Such a transformation ought also to ensure considerable national savings in the Army and Navy services, which ought to

be transferred for the maintenance of that higher intensity of cultivation and crop-production destined to suffice for double our present numerical population by the end of the present century. All sections of cultivators of the soil should arise—the arable, the pastoral, the market gardener, the fruit grower, the owner of or cultivator of large estates and small.

We cannot include the forester, for, alas! there are no forests as yet on a whole third of our entire insular surface. Here is a waste of sunshine and rain alike, and with them near fifty million sterling annually (!) for the indulgence in this national *laissez-faire*; that conscious submission of "intelligent" man to crude evolution, unassisted, paying abroad over twenty million sterling annually for hardy timber, and losing to our potential population an equal amount of wages in its production. All those above named (the would-be forester included) should prepare and combine to give utterance to their long suspended claim to be heard.

Thus your columns would only fulfil a natural function of great potentiality in the furtherance of the true interests of the nation, by making the aspects known to those unacquainted with, as well as to those really interested, the question, and who may have under-valued the force of union which triumphs so strikingly in little Belgium.

"L'union fait la force!" Every holder and every cultivator of an acre in these Islands should combine for the efficient representation of the interests of agriculture in its widest sense. I hope that the *Journal of Horticulture*, amidst much gardening, will nevertheless give voice to the need for greater consideration of this greatest of all the industries. The most precious heritage of the British nation is its soil.

The vast results arising from the influence of men and measures on a nation's development, should indeed be enough to crystallise attention on the present issue developing before the nation.

The new departure in Nature Study as part of the education of the young is quite after Huxley's own heart's desire. Nature study, which, enlarged, means geography and physiography, is the bedrock of all sound national economic knowledge and experience, and will again engender prosperity in its wake. Professor Dewar told his audience at the meeting of the British Association at Belfast a year ago that it would take this nation sixty years to arrive abreast in training where the German nation stands now. My rejoinder is that, with Nature Study to develop faculties of observation—a spirit of inventiveness and resource will be evolved from a thoroughly organised national system on Huxley's lines that will at that distance leave all other nations behind, unless the same course be adopted in order to remain a match for us. [Nature Study, that is, natural history, is taught liberally throughout Germany.—ED.] Thus much I venture to prophesy, but all depends upon the earnestness of the sympathetic trained teacher.

When our daughter dependencies see our destiny is being accomplished on lines here adumbrated, they will need no persuasion or any agitation as now progressing at home. They will acclaim, of their own accord, that the time has come, because the motherland is awake! This is the interpretation I place on the late Lord Salisbury's last platform utterance, in May, 1902, on this pregnant problem.—H. H. RASCHEN, Sidcup, Nov. 29, 1903.

#### National Roads.

We learn that a great scheme of National Roads to serve the immensely-increased and rapidly-increasing road traffic of the United Kingdom may be brought before Parliament as a result of the inquiry just concluded by a Departmental Committee appointed by the President of the Local Government Board. This Committee, of which Mr. J. G. Lawson, M.P., was chairman, will, it is understood, make some striking recommendations in its report with regard to the construction and maintenance of roads, but none more interesting than that the great roads—such as the North Road or the Bath Road—should be taken over by a new department of the Local Government Board and improved and maintained by the State. There is at present an almost Chinese jumble in the distribution of authority over roads in England and Wales. There are in London alone twenty-nine highway authorities, and 1,855 throughout the rest of the country. It is understood that it will propose that all the chief roads in a county shall be placed under newly-constituted county highway boards, to which county boroughs shall have the option of entrusting through routes in their boroughs. This is what France has already done, for the Paris roads come under the Seine department. These county authorities should have power to compulsorily acquire land for road improvements. One of the witnesses before the Committee, Mr. Moncur, chief surveyor of Staffordshire, is understood to have given a sketch of a scheme for special side tracks for motor traffic along roads in the country, with bridges or short tunnels at junction points. To meet the cost he suggested an annual tax of £10 on motor-cars and 10s. on bicycles.

## Trees and Shrubs.

### Olearias.

No better shrubs for planting in town gardens or on dry-land places, can be chosen than *Olearia Haasti*. Plant it where you will, it seems to flourish and produce masses of its white, Daisy-like flowers. The plants may be placed 2ft to 3ft apart where close groups are desired, and it is frequently planted in such a fashion as this, or for covert-belts in the more forward parts of outlying grounds, yet this is perhaps putting it to too mean a use. The species *stellata* (syn. *Eurybia Gunni*) is not generally so utilisable, but the starry flowers are more beautiful than those of the former. It is well worthy of pot culture. *O. macrodonta* (*O. dentata*) is the largest species, and furnishes a handsome dwarf foliage shrub.—F.

### White Pine as a Shelter Tree.

That the branches of the White Pine are apt to snap in severe storms when trees are old is well known, and this fact sometimes deters one from planting the tree. But this snapping does not occur to any great extent when the trees are young, the branches being more flexible. This should be remembered in connection with its use as a wind-break or shelter-affording tree, for which purpose but few evergreens are its equal. In the most exposed places it stands better than almost any other tree. The reason is to be found in the soft needles it possesses. These suffer but little in gales of cold wind, as they give to the gale, instead of standing rigid and combating the wind as does the Norway Spruce, for example. By a little pruning of side branches when young, the White Pine can be made a bushy tree.

### Veronicas.

There are three principal groups of these flowers for the garden—the shrubby kinds from New Zealand, the tall or long-spiked European and American Veronicas, and last and least the tiny creeping herbs, found in many places of the world. The fairest of the latter is the little *Germander Speedwell*, the prettiest of native blue flowers, the *Forget-me-not* excepted. There is a variegated form of the plant, but like the variegated Strawberry, and many other streaked leaves, it is apt to revert again to green. But the normal wild plant is prettier than any of its exceptional forms.

There are several creeping Veronicas quite worth a garden place, and none better could be chosen than *V. Teucrium* or *V. rupestris*, as it is sometimes sold under. Carpets of these spread on a dry, hungry soil, and are masses of colour during July. There is a little Veronica that is sometimes used for covering plots in cemeteries. It is *V. repens*, a plant much like a reduced *Creeping Jenny* in appearance, but with pale blue flowers. The plant has much less claims to a place than has *V. Teucrium*, for it suggests in appearance one of the Veronicas found in this country as a weed. The increase of these small plants must be more than whispered of. They are only small in stature, for, spreading and rooting every month, they will choke any small thing near. That is why the finest plant of this section, *V. Teucrium*, or *V. rupestris*, is safer in a border that does not favour luxurious plants. It is a fine subject for a roof garden, as illustrated in the last volume of this Journal, and is nowhere better than when strayed on to a gravel path. If the borders of a garden were edged with the variety of plants put forward for this purpose at some time or another, the result would be of a truly mixed style, for almost each plant would be of a different kind. Yet good edgings made of living materials are not common, and tiled and other devices are often preferable. One of the best plants to form an ornamental edging with is the golden green *V. cupressoides variabilis*. The typical *V. cupressoides* is not so useful, as its foliage is green, whereas the former is very effective in colouring, especially during winter. It is very compact and dwarf in habit, and has leaves as much unlike a usual shrubby Veronica as could well be. So like the *Cupressus* or *Retinosporas* is this and other similar Veronicas, that for a time they were supposed to be such. The structure of their wood reveals their true character, as also do their flowers, but in this group of queer leaved kinds, these are not freely produced by young plants, and often not by old. They are usually small and white in colour.

One of the most useful of robust shrubby Veronicas is the willow-leaved, *V. salicifolia*, often literally covered with short spikes of pale purplish fragrant flowers. No Veronica seeds so freely, or is better adapted for shrubbery planting, or in plantations with Mahonia. To reach its best condition it should be grown in an isolated bed, where its evergreen foliage is ever attractive. The leaves of *V. Bidwilli* are small and in keeping with the plant, for the flowers only rise about 6in above the ground. It is one of the latest flowering plants: commencing in July, it continues until severe frosts occur.—D. S. FISH (in "Agricultural Economist.")

***Lælia anceps* Oweniana.**

This received A.M. R.H.S., 1902. The sepals and petals are brilliant rose, paler at base, with white patches. Lip, rich magenta, the yellowish throat being streaked with the same colour. It was shown by Mr. Owen, Selwood, Rotherham.

***Vanda cristata* and *V. Denisoniana*.**

In *Vanda cristata* we have a very peculiar species, the construction of the lip being very singular. It is triangular with a three-lobed tip, yellow, with blood-red streaks. The outer segments are narrow and greenish-yellow. It thrives with *V. cærulea*. A chaste and lovely plant is *V. Denisoniana*, a stout grower, bearing pure white blossoms, which is rather rare in Vandas. It is a native of high altitudes on the Arracan Mountains, and enjoys a cool, moist régime all the year round.

***Vanda Hookeriana***

is a tall, scrambling species, with cylindrical leaves and short spike of flower. These are very beautiful; the sepals and petals whitish, with spots of purple; the lip purple, with crowded spots of a deeper hue. No one should attempt the culture of this species who has not ample heat at command. It grows in sweltering heat and moisture, and except for a week or two after being planted should be fully exposed to the sun's rays. In many collections it is the custom to cut the stems into lengths, and plant these in beds of sphagnum in a house fully exposed to the sun. A luxuriant growth and abundant supply of flower is thereby assured.—B. G.

***Lælia anceps*.**

The flowering period of this, the most beautiful of winter blooming *Lælias*, is at hand, and although the growing season has not been what one would call favourable to its success, yet we are assured of a good supply of blooms. Those who, perchance, live in the neighbourhood of foggy towns are generally precluded from growing it, or give up the idea altogether, because of the risk incurred of losing the bloom by a visitation of the fog fiend. Yet I think it is worth all the risk, for what is more beautiful or useful at this time of year than a display of *Lælia anceps* in bloom? Those who have the good fortune to live in rural districts and who grow them in quantity know full well their value. There is everything to recommend them in all collections; the flowers will last from a month to six weeks in beauty; we get a variety of colours, ranging from deep purple to pure white; they have fair size; and, lastly, they are by no means difficult plants to grow successfully.

Where a large quantity are grown, a house, or part of it, is generally devoted to them. In the former case the necessary cultural details can be applied to better advantage. There are several important cultural details to be remembered attending their success, but the difficulty is to know when and how to provide these various conditions to advantage. Therefore a few remarks on the most essential points will not be out of place.

Firstly, they require plenty of light. This is necessary all the year round, whilst in summer only enough shade is required to prevent the sun burning the foliage. Secondly, plenty of fresh air. This also at all times of the year, night and day, less, of course, in cold, windy weather. In summer, however, if occupying a house by themselves give more at night than day. Thirdly, watering. Water must be given sparingly when the plants start into growth, increasing the quantity as the growth advances and the bulb begins to show.

As the spikes begin to push rapidly a good supply is required, and on no consideration should they be allowed to shrivel at any time. In summer, on warm afternoons, we give our plants a thorough spray overhead, the results of which are always beneficial. When the flowering period is past, and until growth commences, they should be given a rest in a minimum winter temperature of 55deg, withholding water so long as the pseudo-bulbs remain plump. When in flower, however, a temperature of 60deg will be found the most suitable.

The time for repotting must be decided by each grower, but undoubtedly the best time is when root action takes place, and not before. A suitable compost will be found in good fibrous peat and sphagnum moss, using Bracken rhizomes for drainage instead of crocks. Perforated pans are preferable to baskets, these being much neater and more easily potted when occasion demands. Overgrown specimens should have their projecting leads cut off with three or four bulbs attached, thus leaving the original plant in its receptacle to develop growths from dormant buds, which, if in good condition, does not take long to accomplish, as very often strong leads will form the first year and produce flower spikes. This is a very successful way of increasing one's stock of good varieties. With the severed pieces another specimen can be made up, arranging the growing points

inwards, so that disturbance will not be again necessary for a few years.

Place pieces of charcoal and turfy peat firmly amongst the roots, finishing off by inserting alternately lumps of peat and clumps of picked heads of sphagnum moss. Plants that have to be repotted require little water at the roots for some time afterwards, beyond an occasional spray overhead on bright days. Amongst the best known white varieties may be mentioned: *L. a. Schröderiana*, *L. a. Sanderiana*, *L. a. Bull's alba*, *L. a. Hilli*, *L. a. Williamsi*, *L. a. Stella*, *L. a. Hollidayana*, *L. a. Dawsoni*; and among the many dark forms, *L. a. Chamberlainiana*, *L. a. Crawshayana*, *L. a. Amesiae*, *L. a. Percivaliana*, *L. a. Measuresiana*, *L. a. Ballentineana* and *L. a. Protheroeiana*.—J. MACKAY, Highbury.

**Cultural Notes: *Dendrobiums* and *Odontoglossums*.**

The autumn flowering *Odontoglossums* of the grande and Insleayi types have sometimes a little lee-way to make up with their growth after the flowers are past, and where this is necessary a little extra warmth and moisture should be allowed. Sometimes, too, the roots may be moving, and a little top-dressing of the compost may be needed. But after the growth is properly made up, these *Odontoglossums* like a much more decided period of rest than those of the crispum and similar types. The drying of the roots must not go to the length of shrivelling the pseudo-bulbs, or weakness will be caused.

*O. citrosum*, on the other hand, has to be thoroughly dried to ensure its flowering, and any shrivelling of the pseudo-bulbs that takes place in winter is soon picked up again in spring, when the moisture supply is again freely given. There are many of the short-bulbed sections, such as *O. Cervantesi*, *O. Rossi*, and even *O. nævium*, that must not be dried although at rest, for the small pseudo-bulbs cannot stand the strain, while *O. luteo-purpureum*, *O. Halli*, *O. triumphans*, *O. Pescatorei*, *O. Andersonianum*, and *O. cirrhosum* will, many of them, be both growing and rooting now, and consequently must be kept moist.

The earlier batch of *Dendrobiums* will usually contain specimens of *D. aureum*, *D. nobile* and the hybrids, having one or both of these well-known species as parents. Avoid over-moistening, in the atmosphere more especially, as this will lead to many of the nodes producing growths instead of flowers. *D. nobile*, *D. crassinode*, *D. Wardianum* and *D. Endocharis* are especially prone to this mishap, and many plants have been spoilt for the season by these means. With the later plants there is not so much danger, though even here a dry, warm air, with hardly any root moisture, is essential.

*D. moschatum* rarely ripens its growth of the present year thoroughly; but all the same a rest is needed by the older stems if a good flowering return is expected. A cool vinery, or some similar structure where the specimens can obtain plenty of light, suits them now. It may be noted here that the stems of this fine *Dendrobium* go on producing flowers year after year until exhausted, so that they should not be removed. *D. Dalhousianum* is like it in the latter respect, but is more regular in its routine of growth, and usually finishes up its stems annually. *D. formosum* must be kept dry and warm, but as the leaves usually remain on through the winter, sufficient moisture to keep them fresh is necessary.—H. R. R.

## Book Notices.

**The Journal of the Royal Horticultural Society.**

The October volume lies before us. It is a mine of pressing information on many aspects of scientific and practical gardening. One feature of these Journals of the R.H.S. is the up-to-dateness of the matter and the subjects; the writers, too, are leaders in science and in horticulture. Besides the interesting notices about the hall and the garden—notice that are of the keenest interest in these passing days—and the abstracts from current periodicals (one of the best sections of the R.H.S. Journal), there are the following papers. Fungoid pests of the garden, in which Dr. M. C. Cooke deals with over eighty diseases of fruits, alphabetically arranged. Besides woodcuts and half-tone illustrations, these diseases have three coloured plates, on which are figured forty-two subjects. We think a little more space between each might be good, or divisional lines might be devised. After this comes a paper on the use of ether and chloroform for forcing shrubs, which brings the discoveries and experiments with these anæsthetics up to date.

There is a growing knowledge and interest in the lesser-known trees and shrubs, and both Mr. Nicholson's paper and that by Mr. James H. Veitch (the latter describing new Chinese trees and shrubs) will be studied widely. Mr. Veitch's paper, which is well illustrated, is a grand contribution to the "Journal" (R.H.S.). Prof. G. Henslow goes into Darwin's natural selection v. adaptation, in his usual able and attractive style; while, in his paper, "The Blue Nymphæas," Mr. J. Hudson, of Gunnersbury House Garden, gives the gardener some cultural hints.

Every paper is of high value. We have read Mr. Bentley's remarks on the Show Tulip with eagerness, but alas! the Show

Tulip is so difficult to make perfect that it will always be left to the devoted few. Then, what more interesting to Imperialists (as all of us ought to be) than Mr. Pickstone's paper, given before the Horticultural Club, and printed here, on "Fruit Culture at the Cape?" It is readable from end to end, and supplies a host of facts. And to the would-be emigrant or young man bent on going abroad, what more cheering than the message given in Mr. Hunt's paper entitled, "Horticulture in New Zealand?"—namely, "A hearty British welcome awaits the new settler." Mr. Hunt says: "What New Zealand wants is strong, hardy young men for country life, who will help to break down and bring the bush into cultivation . . . ; and as there is a surplus of young gardeners at home (so it is said), what better move than to make a healthy home in "Britain of the Southern Seas?"

Daffodil enthusiasts are under a debt of gratitude to Mr. W. Bartholomew for his painstaking researches into the rooting of the Narcissus. He has gone minutely, patiently, and persistently into the rooting propensities (or lack of them) in a large number of Daffodils, showing by text and photo how long this or that variety was ere it began to root in the soil, how many and how strong were those roots, and other facts about them. Happily Daffodil growers will appreciate these interesting tabulations, and that is sufficient. We might ask, Could not many other amateurs with leisure and means, add profitably to their own and others' knowledge by experiments with other plants? Great things arise from small beginnings.

Bottling fruit is not forgotten, and Miss Edith Bradley, whose bottled fruit beat that of Austin and Co. (trade suppliers) this year, explains her process. There are other papers of value, and the volume, like the others before it, is well worth a guinea, though only ten shillings is charged. But we may again point out to the many practical gardeners who are readers of the *Journal of Horticulture*, and who have not yet become Fellows of the National Society—the R.H.S.—that here is a cheap and easy means of getting a library together:—pay one guinea to become a Fellow, and you receive a quarterly *Journal*, which is a mine of information, put in a convenient and permanent form. Under gardeners also may join. The Secretary's address is 117, Victoria Street, Westminster, S.W.

#### Various Publications.

**THE MANURING OF MARKET GARDEN CROPS.**—This is a fairly elaborate essay by Bernard Dyer, D.Sc., and F.W.E. Shrivell, on Manuring. It is reprinted from the *Journal of the Royal Horticultural Society*, and costs 1s., post free, from Vinton & Co., Ltd., 9, New Bridge Street, Ludgate Circus, E.C. Various kitchen garden and fruit crops, and the manures for them, are discussed seriatim. The book is illustrated. Size 5½ in. × 8½ in., pp. 120.

**THE FARMER'S BUSINESS HAND BOOK.**—The price of this work is 4s. 6d., from Macmillan & Co., Ltd. It is one of the Rural Science Series, of which L. H. Bailey is the general editor. The author in this case is Isaac Phillips Roberts, Prof. of Agriculture in Cornell University, and though, of course, written specially for American farmers, the hints on how to keep accounts, the kinds of accounts, the ledger, the trial balance, accounts with particular fields and crops, &c., &c. It is a very useful companion, indeed a farmer's business book. Size, 7 in. by 5 in. Pp. 300, with a good index.

**PACKING AND SELLING FRUIT AND VEGETABLES.**—A very interesting, useful, and complete illustrated essay, by R. Lewis Castle, a well-known horticulturist. This was written for the Fruiterers' Company, and won their gold medal prize. It is now published in convenient book form of over 140 pages, about 8 in. by 6 in., by Messrs. Collingridge, Aldersgate Street; 1s. 2½d., post free. It is practical.

**PICTORIAL PRACTICAL BULB GROWING.**—Mr. Walter P. Wright has produced a series of shilling books dealing with various garden departments. This illustrated book (pp. 152; Cassell and Co.) treats also of Cannas, Dahlias, Begonias, besides true bulbous genera.

## Notes on Hardy Plants.

### *Anemone alpina* and its variety *sulphurea*.

The genus *Anemone* is one of the most attractive of the many beautiful genera which combine to give our gardens their highest attractions. It comprises many of our most delightful flowers, and it may safely be said that there are few members of the genus which do not commend themselves to the lover of flowers. Some are of comparatively tall stature, while others, typified by such plants as *A. nemorosa*, our common Wood Anemone, are flowers of lowly mien, yet of high beauty in our eyes.

Among the most pleasing of the taller *Anemones* which can be used with profit in borders and in rockeries alike, we must place the beautiful *Anemone alpina*, with its form *sulphurea*, frequently considered to be a distinct species, but placed by the best of present authorities of the day as a variety only of *A. alpina*. Both of these are very beautiful flowers, with finely divided and elegant foliage, from which arise on tallish stems pretty flat cup or saucer-like blossoms of considerable size.

*Anemone alpina* is widely distributed, and is said to occur in the Caucasus and in North America, as well as being plentiful in the European Alps on snowy ranges, and on the lower mountains and the slopes of the valleys. In its stature it varies greatly according to its position, the character of the soil, and the amount of moisture available for the plant in its growing season. From four or five inches to between two and three feet may seem a wide range of stature, but this is found in this Alpine *Anemone* in the various places where it grows in a wild state. It is not very fastidious, yet many seem to fail with it, though it will thrive as well in the border as anywhere, making a pretty effect with its white flowers deeply tinged with blue on the outside. Following the flowers come the round heads of silken-awned seeds, which are very ornamental for a long time after the plant has finished its flowering, which begins in the end of April or early in May.

Of equal value is the variety *sulphurea*, whose flowers are, however,

of a pale, sulphur yellow, of an unobtrusive but pleasing hue. It corresponds otherwise to the typical *Anemone alpina*, so that one need not burden these notes with further detail. It may be said, however, that while *A. alpina* has its habitats in calcareous soils, *sulphurea* is found on a granite formation. This may be of service to some who have had difficulty in growing these *Anemones*, but it may also be of some assistance to say that I have found no difficulty in cultivating *A. a. sulphurea* in soil in which there is a good deal of calcareous matter. As has been previously remarked, *A. alpina* will thrive well in the open border, and the finest display of plants of the type I have yet seen were plants raised from seeds, and growing in an open bed of cool soil in a nursery in a cold locality.

The easiest method of raising a stock of *A. alpina* is by means of seeds, which are best sown whenever properly ripe. An established plant will soon give plenty of seeds, and these are best sown in a cold frame, pricking out the young plants in favourable weather when they have attained sufficient size to handle. A mass or groups of the Alpine *Anemone* in a large rock-garden or in the "Wild Garden" is a sight worth seeing, but there are few places in this country where it can be met with. That there are not many is

much to the loss of those who have plenty of room for such a display, but who have not gone to the trouble of securing it. To the many, however, one or a few plants can be recommended as aiding the interest and attraction of any garden of hardy flowers.—S. ARNOTT.

MR. PETER BARR.—The veteran seedsman and florist sails this week for Cairo. He intends to visit Egypt, Palestine, and Greece, returning in May or June next year.

*Lælia anceps Oweniana*.

### Successful Varieties.

It is seldom we find all varieties of Japanese succeed in the same season, even given an equal start in growth and date of introduction. A variety that was almost universally successful last season may not be seen once this year in its proper form. Why, it is difficult to say. Some peculiarity about the constitution in conjunction with certain kinds of weather at a particular stage, may account for such discrepancies as bad colour, want of perfect development of the petals, as also colour. Again, a variety may not this season be anything like the size in diameter and depth that it naturally reaches when the season is suitable for this particular kind.

Those who have not the opportunity of seeing the leading shows in various counties are no doubt interested in knowing what varieties are "doing well," as the phrase goes. For their benefit I have jotted down a few of the leading varieties I can recommend this season. At the same time I purpose naming a few of the non-successful.

F. S. Vallis is the flower of the year without a doubt. The blooms are massive, splendidly built-up in the centre; the long florets have a graceful droop which is at once elegant, besides the colour is all that one could desire—a true yellow.

Mrs. Mileham is all I said it would be when introduced a couple of seasons ago—an improved Mrs. Barkley. The florets reflex naturally, showing freely that lovely deep rose colour. The blooms, too, are more refined than many of the huge growing varieties.

Edwin Molyneux still holds its own as the brightest coloured variety we have. It does seem strange that it is the only variety in existence now popular, that was introduced with others at the same time, seventeen years since. From the millions of seedlings there has never been one to equal it in colour, nor one just like it. [What of Alfriston?—Ed.] Henry Barnes, an Australian seedling, is the nearest approach. This has been shown well this season, but it lacks perfection in the centre of the flower. In colour it is extremely rich, having a suffusion of plum over the crimson.

Mrs. Greenfield is quite one of the best of yellow flowered varieties. The florets are broad and the blooms are compact, yet not without grace. The habit is dwarf, which is really a point in its favour.

Bessie Godfrey is quite the best of Mr. Godfrey's introductions: a full, massive flower of a soft, yet rich yellow. The florets and general character of the flower is all that one could wish for.

Sensation, with the strong dashes of bronze upon the yellow, marks this variety as a true sensation.

Nellie Pockett and its yellow sport, Mrs. T. W. Pockett, are so consistent in their manner of growth and production that they are indispensable as cut blooms. In addition they are most suitable for specimen plant growth or for "bush" training.

Miss Elsie Fulton maintains its position as the best flower in the Japanese incurved section. The massive petals are sufficiently tight to render it solid, yet beautiful.

Mdme. Paolo Radaelli was this season quite at its best. Generally it is of huge size, with loosely incurving florets, and of a pleasing shade of pink. In some few instances nearly white flowers have been seen, but this is more a question of culture than fault in the variety.

General Hutton (bronze yellow) is well worthy of its place amongst a select list of Japanese; and Mrs. George Lawrence, with its somewhat narrow florets of yellow, splashed and striped with crimson, is a distinct gain.

Mafeking Hero has rendered good service to several exhibitors, its bright red colour being conspicuous anywhere. Godfrey's King, too, is another of huge size, with a tendency to be incurving. It is bright chestnut red on the reverse side, dull crimson on the surface. Australian Gold, seldom heard of nowadays, was marvellously well shown at Cardiff, and in that condition is one of the best yellow flowered varieties we have. Duchess of Sutherland is extremely rich in colour and of full size. Lord Ludlow is still quite one of the best of bronze yellows: its long drooping florets give grace and fulness to the flowers.

George Penford (crimson scarlet) is occasionally found in good order. The Rev. W. Wilks (deep rose) has been magnificently shown on several occasions. Mrs. H. Emmerton, deep canary yellow, a well built flower, is fine. Mrs. Thorneycroft, apricot, flushed orange, is handsome in every way. Sir H.

Kitchener, with its soft cream suffusion over a rich terra cotta base, is handsome: a full desirable flower.

Henry Perkins, rich yellow, overlaid with chestnut crimson, is a striking variety. Miss Mildred Ware, terra cotta-rose, over amber, is a full, medium-sized bloom. It has, however, one fault—going over in colour quickly.

### NON-SUCCESSFUL VARIETIES.

No one will dispute that we have seen the best of the Carnot family. For the last three years the blooms have been growing less. We see diameter even now, but we do not get the depth or width of petal that characterised this family, and, like all other hard-worked varieties, its constitution is gone.

W. R. Church has not been consistent this season, and hardly a single perfect bloom has been seen. In colour there is a distinct tinge of green at the tips of the florets, exhibiting a want of finish in development.

Mrs. Barkley is another failure. The blooms have been large enough in width, but the florets have lacked regularity as well as vigour. Where the blooms were perfect in outline they were small. Florence Molyneux is quite a failure.

S. T. Wright, from which we expected so much at the end of last year, has been so short in its florets as to be unrecognisable. Calvet's '99 appears to have lost its delicate tint of colour, as well as richness of petal.

Charles Davis has been but once presented in its true character; Vivian Morel and Lady Hanham, not at all.

Godfrey's Masterpiece, Godfrey's Pride, Godfrey's Triumph, and Exmouth Rival are all too small for up-to-date exhibitors.

Guy Hamilton is now too full of quill petals to be of value.

Mrs. J. Lewis is much too short in floret to be graceful or even large enough. Mdme. Herwege is fast following in the same manner. A similar remark applies to M. Louis Remy and Le Grand Dragon. The moment the constitution fails shortness of petal follows.

J. R. Upton has lost that rich tint of yellow that once was its charm. Queen Alexandra is too short in floret to be of service. It is an attempt at reflexing, as well as incurving in the same flower, which is generally a failure.

Lily Mountford has lost that pretty tint of rose colour on the white. Lord Salisbury has lost the crimson that alone rendered its colour desirable.

Mdme. Philip Rivoire is a good "decorative," but nothing more. Mdme. R. Cadbury, with all its elegance of petal, is a thing of the past. Madame Von Andre and its parent are now quite useless [?]. Miss E. Pilkington is a good, late flowering variety, but of no value to an exhibitor.

Mrs. H. Weeks, which had such a run but a few years since, I hardly ever see mentioned now. Mrs. Clayton, its parent Mrs. C. H. Payne, and its sports, are all varieties of the past. Critics have now ceased to argue about T. Carrington and its co-flower, Australie: both are giving way to more recent introductions—Mdme. W. Rousseau and W. Duckham for example.

M. Chenon de Leché, once so popular, has about run its race. Pride of Madford, with all its brilliancy of colour, fails to maintain its footing, and Calvat's Sun is hardly destined to attain the highest pinnacle of fame, while Edith Tabor and Oceana are no more.

The hairy section are quite out of date, for the interest created in this type was but shallow. Lady Ridgeway, at one time a heroine from the Isle of Man, is not in evidence in the exhibition tent.—SADOC.

### Proceedings in the U.S.A.

The second annual meeting of the Chrysanthemum Society of America was held at New York, Wednesday, November 11, with President Harrington in the chair. There was a good attendance of members, and after the delivery of the President's able address, interesting and encouraging reports were presented by the secretary and treasurer. Professor Geo. E. Stone's lecture on the "Diseases of Chrysanthemums" was well received. As a result of the President's recommendations, the committee on revising the constitution was instructed to report at the next annual convention. The annual report was ordered to be printed. It was announced that Elmer D. Smith, of Adrian, Mich., had made a complete card index of all varieties of Chrysanthemums of domestic origin or introduction from foreign sources since the year 1887, together with the name of raiser, disseminator and other descriptive notes. This is a very valuable compilation requiring much labour, and worthy of the highest appreciation by Chrysanthemum lovers. This also was ordered to be printed.

The interest in exhibition Chrysanthemums is increasing in the U.S.A. Over ten years ago they formed a National Chrysanthemum Society, being forty-seven years later than our own N.C.S. The president of the American N.C.S. for 1903-1904, is an Englishman, who, in fact, was at one time on the staff of one of the English gardening journals. Mr. Arthur Herrington, for this is he, has created a considerable reputation since he left England to manage the private and commercial gardens of H. McK. Twombly, Esq., Jersey City, N.J.; and it will be remembered by some of our readers that a few notes about him—

self and the gardens he so skilfully superintends, were printed in the issue for June 18, this year, when describing the tour of the Daffodil King. We print part of Mr. Herrington's presidential address, as follows:

"A year ago, in Chicago, in first convention assembled, we reviewed the past so far as it pertained to the work of the Chrysanthemum Society of America from its inception, took a careful survey of our position as a national society, and imbued with enthusiasm by the support accorded that meeting, resolved that its annual fixity was from henceforth an assured fact.

"The general interest in the Chrysanthemum is well sustained, and there is no apparent reason for any abatement thereof in a flower of such inherent ability.

"In this city in August, 1900, I for the first time attended a meeting of the faithful few who for a decade had held the society true to active purpose, confident in the belief that there was a need for it to be, though general apathy discouraged their efforts. The election of officers brought to me the responsibility of directing its affairs. From that moment one hope was dominant—the hope that ways and means might be found to establish a closer community of interest between the work and the workers; the hope that the society might meet in association with some important exhibition and thus better fulfil its mission. The Horticultural Society of Chicago provided the first opportunity, and its noble effort has been ably seconded by the American Institute of New York, with ten other societies co-operating.

"The record of the proceedings of the society, as published, has already been alluded to. It is a valuable compendium of information, containing that remarkably comprehensive series of papers submitted at the Chicago meeting, and which, if justly appraised, more than compensates for the cost of membership. A subject worthy of thought is how we may enhance the interest and the resultant practical value of our annual publication so as to make it sought after, to make it a means of bringing into and keeping within the fold of membership those members—and there might be hundreds of them—that are prevented or are unable to attend the annual meetings. Could we not enlarge the scope of our publication; make it a Chrysanthemum Year Book, and therein review the season of the flower, enumerate the new ones as they appear, and describe them in a few terse but readable articles that would tell more, and with better effect, than the conventional catalogue descriptions? Even work of this character is directly in line with our object, and can be better done by our society than by the average individual. We extol the fact that the literature of the Chrysanthemum surpasses that of any other flower. Do we not, then, owe it to those who shall come after that the record of our time shall be handed down complete and unimpaired? In conclusion Mr. Herrington suggested the formation of several committees for the various phases of the society's business.

The following are novelties:—Madona, exhibited by H. W. Rieman, Indianapolis, Ind.; light pink, Japanese incurved; scored, commercial scale 86 points. Golden Age, exhibited by Nathan Smith and Son, Adrian, Mich.; deep yellow, Japanese reflexed; scored, commercial scale, 86 points. Seedling No. 3, exhibited by Richard Rothe, gardener to Clay Kemble, Esq., Laverock, Pa.; white, reflex Japanese; scored, commercial scale, 84 points; exhibition scale, 84 points.

Among the modern gems in collections at New York were Violet Lady Beaumont, Wm. Duckham, Henry Barnes, Guy Hamilton, Chas. Longley, J. R. Upton, Queen Alexandra, being particularly worthy of mention. These all were sent out from English nurseries.

#### Incurving Japanese Varieties.

Some ten years since it could safely be said that this type of the Japanese Chrysanthemum almost had a preponderance in the number of its varieties. I allude to the days when Oceana, Robert Owen, and W. H. Lincoln were in the ascendant. Since then public taste has so favoured other types on account of their greater variety of petal, giving much more grace and less stiffness in character, that it is seldom we now see a true type of Japanese incurved. Especially is this noticeable where classes are made for this section entirely, as was the case at some few shows even during the past season.

From experience I have come to the conclusion that committees might well spend their money to greater advantage than in offering prizes at all for this section, except, of course, they stipulate that the blooms staged shall belong truly to that type. The answer from an exhibitor would naturally be, Where is the authority to define what really is a Japanese incurved? One naturally turns to the N.C.S. as a central body to clear up such points—important ones too. If such details do not come within

the province of this body, what does? is a reasonable question to ask. In the absence of such information I append a list of what I class as belonging to the Japanese-incurved section. If exhibitors would stage blooms true in character we should see this a pretty class, and one that would have some educational value also. I know it is possible at times to find blooms of some of the varieties named below that are not strictly incurving. Such blooms are not cultivated to perfection, and therefore should not be in a competing stand. What I include here are varieties that are truly incurving when presented in perfect condition.

Madame Paolo Radaelli, pale rose, tinted faintly with yellow; Nellie Pockett, white; Mrs. T. W. Pockett, rich yellow; W. Duckham, white, deeply flushed lilac, or pale mauve, an excellent variety for this section; Australie, purple rose; Duchess of Sutherland, orange yellow; Miss Elsie Fulton; Mrs. H. Weeks, pearly white, with a faint flush; Calvat's Sun, canary yellow; Hairy Wonder, bronzy buff; The Wonderful, chestnut bronze; Lady Ridgeway, salmon buff, shaded rose and gold; Mdme Ad. Chatin, white; Mdme. Waldeck Rousseau, chocolate crimson, bronze reverse; Godfrey's King, reddish crimson, golden reverse; Miss Alice Byron, white; Modesto, orange yellow; Oceana, pure yellow; N.C.S. Jubilee, deep mauve; and President

Hardy Cyclamens.

Bevan, yellow, with rose shadings. This variety, I note, is classed as an incurved variety, but, in my opinion, its correct section is the Japanese incurving varieties.—SADOC.

#### The Variety Mrs. J. Dunn.

Will you kindly note that the Chrysanthemum mentioned on page 463, "Miss Ellen S. Kerr," is the same thing as Mrs. J. Dunn, which has been so well exhibited? After I had seen it, it was renamed.—H. SHOESMITH.

#### Hardy Cyclamens.

It would appear that hardy Cyclamens are unknown to a very large number of gardeners. This is not to be wondered at, for their claims are too little urged, their modest beauty of form is seldom illustrated in gardening papers, and, being so infrequently cultivated, young men seldom see or hear of them. Some of the species of hardy Cyclamens flower in the autumn (are flowering now), and others come forth in the spring. But their neatly clustered foliage is pretty at all times. The little corms may be planted in scattered colonies almost at any mild period of the year, and we would suggest that a few be also grown in pans for spring decoration in the conservatory. C. Coum is one of the most robust and most satisfactory for this purpose. The best position out of doors is between masses of Shield Ferns beneath Elm or other not too densely leafing trees, and a porous, yet cool, moist, humic soil is desirable. C. repandum is the most fragrant of the species. Others are Atkinsi, purple and white; Coum, light purple; europæum, reddish purple; ibericum, red; neapolitanum, red and white; hederæfolium, purple; and verum, dark red.

### Large Plants of Lorraine Begonia.

In reply to J. Clues (page 511) regarding the above, I should say that plants of such dimensions as he speaks of must be grand specimens, and are certainly a record size. They beat all that we have seen exhibited at our November exhibition here in Edinburgh. I have grown them trained as pyramids on a wire trellis, in a 6in pot, quite 3ft through at the base, to over 3ft high. I have plants of this season's growth, both of Lorraine, and the white variety, Turnford Hall, about 3ft through, by fully 2ft 6in high, also in 6in pots. While discussing this, which is, in my opinion, the most beautiful of all winter-flowering plants, may I ask, Can Mr. Clues, or some other lover of this graceful subject, give its many admirers any information about how to produce large flowers, as well as large plants?—G. C., Edinburgh.

### British v. Foreign Apples.

There is much truth in what your correspondent, "G. C.," says, on page 481 of the *Journal*, respecting imported Apples and Apples grown at home; and one has only to taste them cooked to prove that the home-grown fruits are far superior to the imported ones. Granted that the high-coloured Baldwins, and some of the other varieties sent to this country, are very pleasing to the eye, but to the taste they do not compare favourably to English-grown fruit, neither does the colour of the flesh recommend them. Taking luncheon at a friend's house a short time ago, at which Apple-tart was served as a sweet, I remarked to my friend, "These are not English Apples, are they?" The answer was, "No, they are foreign; they cost threepence per pound." And although I do not remember tasting any cooked before, I felt sure I was right in remarking they were not English. The only Apple that I know which resembles the foreigner in taste and colour of flesh, is the noble-looking variety, Lord Derby, and this I only consider a second-rate Apple. Were I planting Apples extensively, I should only plant one of this variety, although a neighbouring gardener, who presides over a nobleman's garden, thinks there is no other Apple like it. But I am inclined to think it is the appearance of the Apple only which leads him to make this remark.—R. MORSE, Bath.

### The Raid Against Show Boards.

In support of what "J. D." says, page 511, I know of no action against Chrysanthemum societies (and, indeed, against any special floricultural society at whose exhibitions cut flowers are invited) so pregnant with disaster as the ill-considered proposal to abolish show boards. We have lately been treated to somewhat gushing articles in one of the gardening papers in praise of vases, and in depreciation of the show boards. Much can be said in favour of showing specimen blooms on long stems in vases, and they are most effective when the blooms are good, and they are properly staged. In reference to the last proposition, I have to state that I have attended Chrysanthemum shows during November, at which blooms were shown in vases, and they were among the worst staged subjects. Two shows in particular, which rank among the best held in the provinces, I could mention in which the vases of three blooms were crowded on dark side tables, where only a few of the front blooms could be seen. To ascertain the names of the varieties was practically impossible. One of the drawbacks of a vase class is that they monopolise so much table space when they are properly exhibited. When the class for twelve vases, of six specimen blooms in each, was introduced to the schedules of prizes of the National Chrysanthemum Society, some members of the society appeared to think me insane when I arranged that a table, 60ft in length, by 6ft in width, should contain four exhibits only, each having a run of 30ft by 3ft. And yet this proved none too much to display the contents of each vase to the best advantage. It therefore came about that three such tables, representing a superficial area of 1,080ft, had to be provided in this one class alone. At the recent exhibition of the N.C.S. at the Crystal Palace, I was unable to give each twelve vases more than 24ft by 3ft; and they did not look nearly so imposing in the restricted space. In addition, the exhibitor must either provide vases, or the society offering the prizes must do so. They are somewhat costly to buy, and most inconvenient to store on the part of the exhibitor; while if they are purchased by the society and stored, they become an expensive asset, especially with breakages and occa-

sional pilferings. Such points as these are scarcely considered by editors and writers in gardening papers, whose knowledge of the business side of flower shows is a very scanty one. What "J. D." says with regard to the necessity for providing larger prizes, and the restriction of the would-be exhibitors' radius (owing to the costliness and cumbrousness of the means of conveyance) I support.

"J. D." is therefore the champion of the exhibitors of small numbers of flowers: to cripple their action as exhibitors, or to take a line which will cool their ardour as cultivators for exhibition, is a great mistake, and might seriously affect the income of a society. More attention is paid to blooms staged on show boards than on those shown in any other way, because the whole surface of the bloom is seen, and the qualities of purity, substance, colour, marking, &c., fully comprehended. Have vase classes by all means, but not to the disadvantage of the exhibitors in small classes. The entire abolition of show boards would mean, as "J. D." says, the extinction of a large number of this class of exhibitor.—R. DEAN.

### The Proposed National Potato Society.

I am glad to learn from Mr. W. P. Wright, the promoter of the proposed Potato Society, that there is good reason to believe that a meeting may be held in London early after Christmas. Mr. Wright, as a County Council horticultural instructor, has naturally been anxious to secure the co-operation of instructors in the counties generally, as all these must be of necessity influential agents. The response to the invitations to the meeting recently issued seems to have been very favourable, and it is hoped that as a result it may be possible to promote a national society devoted solely to the interests of one of our most important food elements, the Potato. It is desired that beyond the holding of occasional exhibitions there should be instituted in diverse parts of the kingdom trials of Potatoes, all conducted on similar lines, and thus obtain satisfactory and conclusive evidence nationally as to the merits of any tested variety, old or new.—A. DEAN.

### The National Dahlia Society.

It will surprise many readers of the *Journal of Horticulture* who have been aware that the National Dahlia Society has found, for two years at least, what seemed to be a satisfactory place for its annual exhibition under the wing of the Royal Horticultural Society, at the Drill Hall; to learn that the Dahlia Society will not carry their next show to the new Horticultural Hall in Vincent Square, but rather back to its old home at the Crystal Palace. When it is remembered that one special aim of the promoters of the new Horticultural Hall was to furnish a central home for all the special societies in horticulture (so far as possible) this refusal of the Dahlia Society to come in under its sheltering roof is disappointing.

But the Dahlia Committee are not to be held absolutely responsible for this decision. That body applied to the Council of the R.H.S. for terms as to the annual show as before, and finding these terms exceedingly onerous, also invited terms from the Crystal Palace Company, which seems to be now in a more prosperous condition financially than it was a few years since, when the Dahlia people left it. When the terms in each case were read to a full meeting of the committee recently held, it was unanimously agreed to accept those of the Palace Directors as being the more liberal: The conditions which were regarded as too onerous, offered by the Council of the R.H.S., were for a two days' show, taking all gate money, requiring that R.H.S. Fellows should compete for the Dahlia Society's prizes, and imposing on all visitors to the show, not members or Fellows, the greatly increased charge of 2s. 6d., instead of the customary nimble shilling. The R.H.S. would provide no other attraction whatever for the 2s. 6d. charge. At the Crystal Palace the charge for admission would remain at 1s. There would, as is always the case, be many extra attractions, there would be no conditions as to other exhibitors than members of the Dahlia Society. Of course the Crystal Palace people would take all gate money, but they would give the Dahlia Society a much more liberal money grant than the Council of the R.H.S. offered.

The Dahlia Committee and officers include some thirty Fellows of the R.H.S., so that the R.H.S. seems to be treating its own people very meanly. The Dahlia Committee protested that to allow Fellows of the R.H.S. to show for their prizes would weaken their own society and greatly deplete members. Also that the proposed charge of 2s. 6d. admission was prohibitory to so many lovers of the Dahlia who wished to see the show, but would not pay so large an admission fee. It was pointed out that the London Dahlia Union, which held its annual exhibition at Earl's Court, met with far more favourable terms there, and where the admission fee was but 1s., whilst other attractions were numerous than the R.H.S. offered to what was the original National Dahlia Society.

I have so far explained the reasons why the Dahlia Society returns next September to Sydenham Hill. The arrangement is, in the interests of the R.H.S., to be deplored, because it weakens at the outset the bond by which it was sought to hold to itself these special societies, and robs the Fellows of a splendid and much enjoyed exhibition of Dahlias. The proposals of the Council indicate sad lack of insight and of business qualities. There never was a time when solid business qualities in a council were more needed than now. When it is proposed to charge visitors the greatly enhanced fee of 2s. 6d. on the ground that the show furnished is so beautiful, the Council yet offer the Dahlia Society not one penny more than they did with but a shilling admission last year. That is a very inconsistent act. Practically it is proposed to flood the show with Fellows of the R.H.S., but to shut out, by a prohibitory charge, all those people devoted to the Dahlia who cannot be guinea Fellows of the R.H.S., or pay 2s. 6d. admission.

It is said that in the new Hall 2s. 6d. is to be the regular admission fee. If that be so, then must trade exhibitors, the backbone of the Society's meetings, greatly suffer, as it will tend to exclude because the charge will be held to be exorbitant to many of the traders' patrons. The R.H.S. never had to face a more critical period of its existence with its grave responsibilities than now, and anything which tends to check its popularity, or to set up the backs of myriads of supporters, would be suicidal. It is a time of all times, when everything should be done in a broad, liberal spirit, and when no effort should be wanting to induce everybody interested in horticulture to rally to its support and maintenance.—DAHLIA.

### The Commercial Needs of the Empire.

We are all agreed upon the advantages of increasing the food production of the Empire, and in many minds the question arises—Can nothing be done to stimulate this most needful of all industries, apart from, or even in addition to, preferential tariffs or taxes on imported food? Could not such time as may elapse before a general appeal to the country be most profitably employed in ascertaining, through a Royal Commission composed of the best and freshest minds of the mother country, and all our dependencies, what our Imperial needs really are? Such an inquiry, under such auspices, would go far beyond any report yet brought to us by individuals or Blue-books, and provide a great mass of sterling information eminently instructive to us all. Whatever the upshot of the present controversy may be—whether we continue in the path of free trade or not—it cannot be doubted that such a fund of information collected from all the best experience of the Empire would provide a vast amount of expert knowledge that might be turned to incalculable account in the future, whatever the course of that future may be. Might not a fully representative Governmental committee also be formed to give help and counsel to our Imperial commerce? This question, among others, might well occupy the attention of a Royal Commission of Inquiry into the commercial needs of the Empire.—JAMES BLYTH, Bart., 33, Portland Place, W., November 12, 1903.

### Protection of Fruit Trees.

Respecting W. J. Murphy's desire to protect his trees, why not adopt the system of the Florida Orange growers? A few years back they were visited by an extraordinary phenomenon, viz., a severe frost, and thousands of fruiting trees were ruined. Under such circumstances home growers would probably have been disheartened, but these exotic fruit growers argued that if it happened once it might occur again. Accordingly they prepared elaborate collapsible sheds, made in sections, of what they termed slats. Others prepared canvas tents, which could be erected in quick time. Large braziers for burning wood, &c., were in readiness, and every preparation was made for fighting the frost fiend, should he show signs of appearing. He did, and has done ever since, but the meteorological officers at Washington and elsewhere wire to the Florida station, and messages are at once despatched to the fruit growers. The railwaymen get the warning up go the sheds and tents, and under these canopies, many of them of the rough and ready type, the trees are brought through safely by the aid of fires. Some of these sheds on large plantations are acres in extent, but it undoubtedly pays. Personally, I think the tent system would work well for blooming trees in this country. The pyramid trees could be covered by bell tents, composed of tiffany or calico, oiled if preferred. These tents should work on wires, so that they could be hauled up during the day to allow fertilisation. If the Florida market men can make it pay I see no reason why it should not do so here. [Except high rent and railway rates!] It is merely a case of spending a little. I do not suppose for an instant that any heat would be needed, but a few smother fires would help to take the raw edge off the atmosphere.—A. W.

### Methods of Fumigation.

Seeing your remarks and reprint from a New York paper on page 482 of the Journal on the above subject, it occurred to me that a brief note as to what is being done in the Royal Botanic Gardens, Regent's Park, might not be out of place. At the present time a series of experiments with an entirely new and improved process are being carried out. Although too early for a general statement, yet its value is practically ensured, and when properly worked out on a standard basis and more generally understood, it will probably be adopted by all classes of growers. In addition to this, experiments are also being carried out with a view to ascertain a cheap and ready means of destroying insects in the soil. Considerable hopes of its success are entertained.—ELDERBERT F. HAWES.

### Red Spider.

Since the discussion in these columns between myself, "H. D.," and others, some time ago, I should like to know if any *Journal* reader has experimented with XL All for the destruction of this pest? A vinery containing Muscat and Lady Downe's Seedling Grapes, among others, was again used for housing Chrysanthemums, and as green fly made its appearance on the "Muns," vaporising was resorted to. The house was carefully measured and just sufficient of the XL All was used to kill the green fly, which it did easily. But the fumes of the nicotine compound quite spoilt the foliage on the Muscat and Lady Downe's Vines. This proves once more that it is utterly impossible to vaporise these varieties of Grapes, even for green fly at killing strength, without destroying the foliage on the Vines. But "H. D." in the issue for July 10, 1902, asserts that he killed red spider on these varieties of Vines with XL All without destroying the foliage. Perhaps other readers have accomplished the same feat; but I fail to kill green fly even, without spoiling the foliage on these varieties of Grapes, and red spider is trebly harder to kill than green fly; perhaps fifty times harder.—A. JEFFERIES, Moor Hall Gardens, Essex.

### The N.C.S. Catalogue.

I think it is not too much to expect from a body like that who is supposed to be at the head of the central authority on all matters relating to Chrysanthemum nomenclature that we should get a reliable, interesting, and useful catalogue after so many years of waiting. Can anyone say that the recently published supplement fulfils any one of these requirements? I think a long stretch of imagination will be necessary before I at least come to that conclusion. What are known as the Centenary and Jubilee editions were distinctly interesting inasmuch that the raiser's name is attached to the bulk of varieties, and the year of introduction also. These two items alone serve to render those publications interesting, and useful as a reference at the same time. The present issue is simply a catalogue, not one bit better nor so good than those issued by the leading vendors of the flower, and yet the charge is a high one for value obtained. I doubt if a second copy will be purchased by anyone who sees the publication. At some shows prizes are offered for varieties introduced in certain years; how can the present list be used as an authority even in so small a matter as that I would ask? The colour description too is excessively vague and misleading in many instances. At one show where I was an adjudicator a prize was offered for six Japanese yellow. Lord Ludlow was the variety in consideration for the premier award. The colour of the individual blooms were as they should be when in good condition—golden yellow, striped and margined with red—whereas the authoritative description is golden amber. The consequence was the blooms in question were passed, the variety coming under the colour description required, whereas if the catalogue in this instance was not misleading a disqualification must have followed. No tradesman's catalogue that I have seen describes this variety in the same manner as the official publication.

A few more instances will sustain my criticism of accuracy in description. For instance, Bessie Godfrey, a variety that has been seen this season in magnificent condition is described as deep cream; it is really a deep canary yellow. Lord Aldenham is described as deep crimson, whereas it is a yellow sport from Edwin Molynex. Amongst incurved varieties irregularities are not so common. Ma Perfection is given as pearly white, tinted pink, instead of pure white.

What a meagre list of varieties is given as representing the Japanese incurved, especially as some societies encourage this section by having classes for them alone. In my opinion only those that are truly incurving under all conditions should be so classed. If this is not rigidly adhered to as the standard, how can exhibitors be expected to stage typical blooms? Calvat's '99 is not a true incurving variety, neither is Queen Alexandra, W. R. Church, Mrs. White Popham, or Exmouth Crimson.

In the section devoted to hairy varieties no less than twenty-two are named. The difficulty is to find two varieties worthy of

a place in any third rate collection, except, of course, it be where a special interest is taken in this type. It is an exception nowadays to find even one variety at an exhibition.—SADOC.

### The Price of Flowers.

Referring to the touching tale under this heading (p. 522 of December 3), I am reminded of an equally true and still stranger Alpine legend. In this latter case it was a young peasant, who was swallowed up in a glacier during the honeymoon: he was only twenty at the time. Some twenty-five years after, the body was discovered by his son, who was living near with his widowed mother, and (an otherwise incredible case, the body being in perfect preservation) of a son being physically older than his father.—A. C.

### Edwardes Square, Kensington.

This fine square, with other property of the Kensington family, was recently put up for sale, but the centre of the square did not sell. The London County Council is anxious to preserve this and many other squares now much in peril of being built over, but there is the money difficulty. Edwardes Square was laid out in 1819 by Aiglio, a notable Italian landscape gardener, in clumps and winding walks. Since then it has undergone some alterations. Russell Square, a still grander space, is a memorial of the work of Repton, dating from 1810, though people found fault with it as being overplanted. It was Repton who wished to lay out what is called Cadogan Gardens to represent a valley, having winding walks, sloping banks, and a small lake in the middle. At that time the place was called Sloane Square, which has caused some confusion. However, it became the nursery of Salisbury, a well-known botanist and author, and subsequently it was for many years in the hands of Tuck, who had at first the middle garden of Eaton Square. In fact, quite a number of the suburban squares have been occupied as nurseries, though at present appropriated to the residents around, or to the public generally.—J. R. S. C.

### The Proposed Gardeners' Association.

All craftsmen and industrial workers must organise "for defence, not defiance," nowadays, and gentlemen's gardeners as isolated units scattered all over the length and breadth of Great Britain and Ireland are like sheep without a shepherd, and their isolation renders them defenceless against imposition of many kinds. If it be true that "union is strength" it must often follow that isolation and weakness are often, even if not always, synonymous terms. A well-organised national union or guild of British gardeners would do more than any other thing I know to encourage the progress and improvement of gardening in the British Islands.—F. W. BURBIDGE.

This is a subject which has been in the minds of many gardeners for years, and often have I conversed with others about the advisability of establishing such a guild, but I have always been met with the question, "Would such an association have any influence on our employers?" It is evident to every thinking man that any conditions which would not meet with the approval of the employers, or at least the majority of employers, would do little to mend matters. Gardening is a profession which gives no guarantee. No society can ever bring about such changes as gardeners would like to see. A boy takes a love for gardening at a very early age (such was my own case), and he becomes apprenticed. Three years' hard work, and he struggles on. Personally, I have now had eighteen years in the various departments, serving respectable periods under some of the best men in the country, particularly fruit growers, yet I stand no better a chance of securing a decent appointment than a man who serves two years in a college! A gardener is not made in two years; no, but influence does more than practical and theoretical knowledge can do. The association should make MERIT the key in recommendations. A gardener, that is, a man I would think worthy of calling a gardener, is a great reader. His calling demands information which he must obtain from several sciences: botany, chemistry, geology, physiography, and it is well to have a good sound knowledge of geography. Besides this, a good gardener is generally found capable of conversing on any subject which is claiming the attention of the public; in fact, he is a man of study. The question is, How can we, as a body, help the man who gives the best years of his life to the profession to obtain a reward in the shape of an appointment? Further, can we, by amalgamation, regulate the wages paid? The latter we can never do: the former can only be done by the help of a society like the Royal Horticultural.—W. B., Ross.

### The Uncut R.H.S. "Journal."

Sir Trevor Lawrence once said the Council had now given over the barbarous practice of cutting the edges of the Society's Journal. We Fellows, then, who wish the edges of the Society's Journal cut, are all barbarians; but, nevertheless, it is a pity that so many of us should suffer inconvenience because of the "petty sentiment" of a few, as "Chelsonian" (page 510) phrases it. Let the Council send cut edges to those who want such. This could easily be arranged.—A SCOTTISH FELLOW.

### Gardeners' Proverbs.

After reading the interesting article by "J. R. S. C.," page 509, I am tempted to add some few further examples. And first I will give an enlarged version of his "Oak, Ash":

Oak before Ash,  
Have a splash;  
Ash before Oak,  
Have a soak.

In the "Quarterly" of July, 1876, it is given as follows:

If the Oak open before the Ash  
'T will be warm and dry, with good Wheat to thrash;  
But if Ash leaves open before the Oak  
There 'll be cold, and of rain too great a soak.  
If the Oak and the Ash open nearly together,  
Look out for a summer of changeable weather.

Weather maxims are almost endless; pretty well every month has one saying at least. I will not inflict all these. Three or four will suffice:

So many mists in March you see,  
So many frosts in May will be.

May has not a good character:

Next comes May,  
Whose withering sway  
Drives all April flowers away.

Charles Lamb remarked of this month:

Unmeaning joy around appears,  
And Nature smiles as though she sneers!

The Hop proverb is:

Till St. James is past and gone  
There may be Hops and there may be none.

Probably drowth is better than drowning:

Drowth never bred dearth in England.

When the sand doth feed the clay,  
England, woe and well-a-day!  
But when the clay doth feed the sand,  
Then 'tis well for Angleland.

I see Peas are alluded to. Beans have also their calendar:

When Elm leaves are as big as a shilling  
Plant Kidney Beans, if to plant you are willing.  
When Elm leaves are as big as a penny  
You must plant Kidney Beans, if you mean to have any.

I will conclude with Apples, with regard to which there is a homely saying:

An Apple, an egg, and a Nut,  
You may eat after a slut!

There is another, more pleasing and very ancient, attributed, I think, to Sappho, and referring to what a graceless world has called "unappropriated blessings," and describing her position:

Like a sweet Apple that hung up on high,  
On the topmost twig there, under the sky—  
Had the Apple gatherers then forgot?  
Oh no! they saw, but could reach it not.

—A. C.

### British Ferns.

#### The Hart's-tongue Fern, *Scolopendrium vulgare*.

In many parts of the country, especially in the Western and South-western counties, the Hart's-tongue Fern is a conspicuous feature of the wayside vegetation, its long, strap-shaped fronds projecting from the hedge-bottoms in company with the Male and Shield Ferns; or on the old walls and stone dykes we may see it in a much dwarfed state lodged in the crevices and associated with several species of the Spleenwort tribe. In the first case we may find huge plants with fronds two or more feet long, while in the second they will hardly exceed as many inches.

In this simple fact we have one of the distinguishing features of the Hart's-tongue, viz., its peculiarly accommodating nature as regards both free and restricted conditions of growth; its wall companions, the Spleenworts, we shall never find growing with it in the soil in the shady woods, nor shall we find, except in extremely rare cases, its associates of the hedgerow growing on walls. Another marked feature of the Fern is the undivided, strap-like frond, a flat blade shaped like a two-edged carving-knife, with a central rib and a stalk, the base of the blade being

shaped like the upper end of a heart. No other of our native Ferns is the least like this, all, with the exception of the little Adder's-tongue, being more or less cut into side divisions, which again are frequently sub-divided. It also bears its spores in a peculiar fashion, the long, sausage-shaped, brown heaps which we shall find on the frond backs in the autumn consisting really of two masses of spore cases, which grow together as they swell and mature.

So much for the common features of the Hart's-tongue; but what will our readers say to the assertion that as regards uncommon features, the Hart's-tongue is perhaps the most wonderful Fern in the world? Yet this is a solid fact, for, considering its normal simplicity of type, no Fern existing, whether temperate or tropical, native or exotic, has been so fantastically varied by Nature as this. Not a single character but has been altered by Nature in her sportive moods, not merely in one, but in many ways; and we would particularly impress upon our Fern-loving friends that the great bulk of these variations have been found wild in our native lanes and woods, or on the walls and dykes frequented by the common types.

A by no means uncommon feature is a division of the frond

begin to grasp the possibility of several hundred distinct varieties existing, and we also begin to comprehend the wonderful side attached to this common plant.

Variety, however, is not necessarily charming; hence we must not omit to emphasise the fact that many of these varieties are far less handsome than the common, while many of the others possess great interest as curiosities, even where tastes might differ as to grace and decorative charm. Undoubtedly the more beautiful are the frilled and the frilled-and-fringed sections (*S. v. crispum*, *S. v. c. fimbriatum*, and *S. v. c. Drummondiae superbum*).

In the *crispum* proper the fronds are not only deeply frilled, but much indented; these produce no spores, all the vigour going into frondage. There are, however, some very "frilly" fertile forms, but the spores are always produced at the expense of thoroughbred form in this section. In the fringed section, however, which has originated from two very distinct wild finds by selective culture, spores are usually produced on a limited scale.

The Stansfield *fimbriatum* arose from a tough, wavy, fronded find (*S. v. undulatum*)—a most unlikely parent, the offspring being thin, papery, and prettily fringed on the edges; and

Study of a Formal Front.

at the top into two or more branches, and this, if all the fronds be affected, is usually a permanent sport (*S. v. lobatum*). This multiplication of the tongue-tip is a feature of fully a hundred varieties, no two of which are quite alike, while in range they vary from a mere fork, down to such a degree of forking and re-forking that the normal strap disappears entirely, and we have an apparent ball of the finest moss in its place (*S. v. densum*, Kelway).

So much for the tongue tip; now for the heart-shaped tongue base, where the stalk joins the frond; this has been lengthened into long points, and also into tasselled ones to match the tip, the frond being thus arrow-shaped, or sagittate (*S. v. sagittatum*); and not content with this in one variety (*S. v. s.*, Dadds), they grow nearly as long as the central frond itself, and turn it into a trident. The flatness of the frond disappears in numerous lovely frilled or "crispum" forms, and the smooth, plain edge is varied in many ways from saw-toothed up to lacey fringes.

Finally the smooth surface has been broken up into a rough one, more or less deeply corrugated or cut, rugose, muricate, sculpturate, or varied with marginal or internal ridges and lines. Hence we see that Nature has left no character untouched; and when we add that many forms are combinations of these variations, and also that dwarfing comes in as another variant, we

the *Drummondiae fimbriatum* sprung from a wild find near Falmouth, and are refined editions of the parent. In these the fronds are not only frilled and fringed, but waved up and down like a switchback, while fine tassels form the frond tips. At present they are certainly an easy first among all the Hart's-tongue varieties.

For a selection we cannot do better than refer to Messrs. Stansfield's or Birkenhead's catalogues. Culture is easy. The Fern likes an open rubbly compost of loam and leaf-mould, and a little lime, with plenty of drainage; and some of the finest forms are worthy of well-lighted case or frame culture, since, though perfectly hardy, their delicacy of make is apt to suffer under open-air conditions.—CHAS. T. DRURY, V.M.H., F.L.S.

STUDY OF A FORMAL FRONT.—This is the season of planting and of alterations. Among other things, new fronts are here and there being designed, and those who have had work of this nature to do can appreciate the assistance of a pattern or suggestive model, whereby to design the features of their own areas. We do not promise that the illustration on this page will be anything more than merely suggestive to beginners; but if it supplies some guiding lines its purpose will be served.

# NOTES & NOTICES

## The Horticultural Club.

The next house dinner of the Club will be held on Tuesday, December 15th, at 6 p.m., at the Hotel Windsor. Mr. George Bunyard, V.M.H., has promised to read a paper, entitled "Notes on inconspicuous flowers—scented—with a view to discussion."

## Mr. E. T. Gilman.

The Earl of Shrewsbury has signalled his esteem for, and confidence in, the above named well-known and excellent gardener by placing in his entire charge the extensive gardens at Ingestre, in addition to those at Alton Towers, over which Mr. Gilman has presided during the past eight years. Mr. Gilman was head gardener at Ingestre for twenty years previous to taking charge of the famous Alton Tower gardens.—J. UDALE.

## The Chrysanthemum Analysis.

The Journal's Chrysanthemum Analysis is being prepared by Mr. E. Molyneux, and it may be in our hands before the end of the present month. We would add to Mr. Molyneux's private appeal to the voters, to return to him their papers as soon as they conveniently can, so that this valuable contribution may be published in seasonable time for the execution of orders by the Chrysanthemum trade growers. The analysis will be on a broader basis than heretofore.

## Croydon Gardeners' Society.

This society at intervals offers prizes for essays on a given subject in horticulture, by which it hopes to create a further interest to the members in inviting them to join in friendly competition. The subject for the last competition was one on "The most economical and best method to deal with one acre of kitchen garden." The first prize-winner was Mr. A. Middleton, Coombe Lodge Gardens, and he read his winning essay before the members on Tuesday week at their rooms, Sunflower Temperance Hotel, George Street. The exhibits staged at the meeting were some specimens of three new varieties of Potatoes, viz., the celebrated "Northern Star," "Sir John Llewelyn," and "Evergood," and the thanks of the members were conveyed to Messrs. F. W. and S. Rogers, Croydon and Thornton Heath, for sending them. The fourth annual dinner of this society will be held at the Greyhound Hotel, Croydon, on Wednesday, February 10th, 1904.

## Potato Growing Test in West Lothian.

Mr. A. S. R. Learmonth, Balderston Farm, Linlithgow, made a special trial of twenty-nine varieties of Potatoes this season, and the results, as under, were contributed to the "North British Agriculturist." Every precaution was adopted to ensure that each variety would obtain identical treatment. The land was ploughed in autumn, after 20 tons of dung per acre had been spread on the stubble. When planting, a dressing of artificials was applied in the drills at the rate of  $7\frac{1}{2}$  cwt. per acre. The land was suitable for Potatoes, being a medium alluvial loam. Twenty running yards of each variety was planted, with sixty whole sets specially selected, to weigh about 2 oz. each. To thoroughly test the disease-resisting qualities lifting was deferred until the beginning of November. Appended are the particulars of the ten varieties which were most satisfactory:—

	Ware. Tons.	Seconds. Tons.	Chats. Tons.	Diseased. Tons.
Evergood .. .. .	10 3 0	2 13 2	0 13 2	0 0 0
Farmers' Glory .. .	9 3 0	1 12 0	1 3 0	1 0 0
The Factor .. .. .	9 3 0	1 1 2	0 13 2	1 3 0
British Queen .. .	7 12 0	1 9 0	0 13 2	1 7 2
Up-to-Date .. .. .	8 6 0	1 4 2	1 1 2	0 7 2
Abundance (Sutton's) ..	7 9 0	1 15 0	0 7 2	1 7 2
Market Favourites ..	7 12 0	1 4 2	0 12 0	1 9 0
Main Crop .. .. .	8 3 0	1 9 0	0 12 0	0 3 0
Royal Kidney .. .. .	6 18 10	1 7 2	1 1 2	0 1 2
Dobbie's Improved Kidneys ..	7 9 0	0 10 2	0 10 2	0 7 2

The other varieties which were tested, and which did not give such good results as the above, were the following:—Bountiful, Britannia, Cigarette, Daniel's Special, Dobbie's Favourite, Duke of Rothesay, Jeanie Deans, Satisfaction, Scottish Triumph, Springfield, Snowflake, The Crofter, The Sirdar, White Elephant, Windsor Castle, Cramond Blossom, Pride of Enfield, and Fortyfold. One of the surprises of the trial was the position taken by Main Crop. Mr. Learmonth believes the splendid result with this variety to be largely due to the entire change of seed.

## The Gardeners' Royal Benevolent Institution.

We understand that the annual festival dinner in aid of the funds of this institution will be held at the Hotel Métropole, London, in June next, when Harry J. Veitch, Esq., the treasurer, will preside, and the exact date will be announced shortly.

## National Dahlia Society.

The annual general meeting of the above society will be held in the North Room, Hotel Windsor, Victoria Street, Westminster, S.W., on Tuesday, December 15th, at 3 p.m. A meeting of the committee will be held at 2 p.m.—P. W. TULLOCH, hon. sec., Sterndale, New Church Road, Hove.

## Royal Horticultural Society.

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, December 15th, in the Drill Hall, Buckingham Gate, Westminster, 1—4 p.m. The committees will meet as usual at noon. A general meeting for the election of new Fellows will take place at 3 o'clock. At a general meeting of the Society, held on Tuesday, November 24th, fifty-eight new Fellows were elected, amongst them being His Highness Prince Frederick Duleep Singh, Lady Emily Dyke, the Hon. Mrs. Cecil Bingham, the Hon. Mrs. Edward Portman, the Hon. Mrs. Henry Denison, the Hon. Mrs. E. Thesiger, the Hon. Lilian Elphinstone, and the Hon. the Minister of Agriculture for British Columbia, making a total of 1,339 new Fellows elected since the beginning of the present year.

## Edinburgh Seed Trade Assistants.

On the evening of Friday, the 4th inst., in the spacious saloon of Ferguson and Forrester's Restaurant, Princes Street, the Edinburgh Seed Trade assistants held their annual dinner. Over a hundred were present, and the chair was very worthily occupied by Mr. D. W. Thomson. The tables were beautifully decorated with choice plants and cut flowers, supplied for the occasion by the leading firms in town. The meeting was a great success, and most heartily enjoyed by the large company present. After the loyal toasts, Mr. McHattie proposed the toast of "The Seed Trade Assistants," being responded to by Mr. Denholm. The toast of "The Nursery and Seed Trade" was proposed by Mr. M. Todd, florist, Edinburgh, coupled with the name of Mr. D. P. Laird, Pinkhill Nurseries. The toast was enthusiastically pledged, and Mr. Laird, in his happiest vein, returned thanks. Other toasts followed, including that of the secretary, Mr. Parker, who was warmly thanked for the pains he had taken in arranging the gathering. Songs and recitations filled up the evening till 12.30, when "Auld Lang Syne" brought the pleasant function to a close.

## Presentation to Mr. R. Sydenham.

At the annual meeting of the Midland Carnation and Picotee Society, held on December 3, Mr. W. H. Parton, junr., honorary treasurer, presented, on behalf of the society, a magnificent illuminated address in album form to Mr. Robert Sydenham, as some slight recognition of his valuable services to the society during its first twelve years. The text of the address is as follows: "We, the members of the Midland Carnation and Picotee Society, desire to express our extreme regret that you have found it imperative to retire from active work in connection with our society. It was entirely through your influence that the society was founded in the year 1891, and we avail ourselves of the present opportunity of tendering to you our sincere thanks for the valuable time you have devoted, and the untiring efforts and important help you have given during the twelve years you have acted as chairman of the committee and treasurer, and which has been to so great an extent instrumental in gaining the reputation and promoting the best interests of our society. We have much pleasure in asking your acceptance of this address, together with the accompanying group of your well-wishers, as a token of our appreciation and regard, and we earnestly hope that you may be spared for many years to enjoy the respect and esteem of your numerous friends, and all those associated with you, which you have always so deservedly possessed. Birmingham, August, 1903."

It had been hoped that Professor Hillhouse would have made the presentation, but he, being confined to his room by illness, was unable to do so. The Professor, however, sent a letter expressing his regret, and wishing Mr. Sydenham health and happiness. Mr. Parton also, on behalf of the society, presented to Mr. Herbert Smith the hon. secretary, a framed copy of the photograph mentioned in the testimonial, on his retirement from the secretarship, which he has held for the past ten years.

## In Pleasant Norfolk.

**D**URING some recent peregrinations in Norfolk, fortune landed us at the pleasant old-world village of Hilgay, where the conditions of life appear to approach somewhat to the "three acres and a cow" standard, judging by the number of allotments or small holdings. Here may be seen breadths of Carrots, there Potatoes, with possibly a strip of corn wedged between; here, again, Red Cabbages, and perhaps Onions. Many of the cottages are gay with flowers, Roses, Dahlias, Sweet Peas, Antirrhinums, &c., the whole giving one an idea of sweet contentment. Our business here, however, lay at

### Woodhall,

a very ancient mansion, the residence of M. Stocks, Esq., who is lord of the manor, and who is well known and popular in the district. As its name implies, the estate is beautifully wooded and the Hall sheltered on all sides. It is a noble building in the Elizabethan style, and over the north front entrance are some quaint carvings and inscriptions, together with the date—1579. The south front is very pleasing, and here are some grand Wistarias, Cotoneasters, and Magnolias (the latter in flower). From here can be seen a fine stretch of park beyond the well-kept lawn; but we want to see further, and so must seek the chief of the garden, Mr. Lewendon, whom we find to be a typical gardener, busy pruning fruit trees, but ready to afford us "a look round." His staff at the time of our visit was busy with Chrysanthemums and other routine work: on every side one notices order and tidiness.

The kitchen garden is about one and a half to two acres. Late Peas were looking well, and Veitch's Autocrat, Chelsonian, Ne Plus Ultra, and Dr. McLean showed fair crops; Sutton's White Gem Celery is exceptionally good; while a good crop of Onions had just been lifted. On a border we found a remarkably fine lot of Czar and Marie Louise Violets, some being then in flower. On another border there was a fine lot of Carnations, and a batch of early flowering Chrysanthemums, including Madame Duffy and Madame Desgrange, with a profusion of flowers. A south border had a crop of Tomatoes (Frogmore Selected), the plants of which were fully 5ft to 6ft high, the fruit being of good size and well coloured. Very noticeable also was a large batch of exceptionally fine plants of Solanums, fully 2ft through, and well loaded with berries, while a fine lot of Callas also claimed attention.

On the walks there was one of the best collections of Chrysanthemums we have seen, and these were being prepared for housing. There are about 600 of them, and all the best varieties are included. Certainly they reflect credit upon the gardener. What a fine show they would make in a large span-roofed house!

Going back to the lawn we noticed some good Roses, late as it was, and here is a specimen Aucuba covered with berries to an extent seldom seen, some fine specimen Irish Yews, and a Pampas Grass with about fifty fine spikes, are noticeable; and in the beds are Fuchsias, Iresines, and Abutilon Boule de Neige, and other things. A border at one end was quite gay with Cactus Dahlias, Roses, Tritoma uvaria, with its red-hot-poker-like flowers, and a very fine lot of Antirrhinums; while some fine plants of Laurustinus were then full of flower.

Coming to the glass houses, we commence with the conservatory, a fine house, though rather shaded. Covering the entire roof is a *Cobæa scandens variegata*, hanging in trails and presenting quite a picture. There are some fine plants of *Phoenix reclinata*, *Latania*, *Blechnum*, *Araucaria excelsa*, *Campanula pyramidalis*, *Lilium*, &c. At one end is a rockery of tufa stone wherein Ferns are revelling. *Pteris*, *Asplenium*, *Rex Begonia*, and even *Agaves* seem luxuriant; and at the base is an *Adiantum*, with fronds fully 2ft long, kissing the water below. It is a noble house, and adjoins a truly handsome billiard room.

Next we visit the stove, which is a fine lean-to house about 42ft by 20ft, and here is a fine collection of plants, including *Pandanus Veitchi* (particularly good, both in style and colour), *Dracæna Jamesi*, *D. Lord Wolseley*, *Cocos Weddelliana*, *Maranta zebrina*, *Alocasia*, a fine specimen of *Nephrodium Nidus*, *Peperomia*, and *Crotons* in variety, all looking well. In the Melon house the winter crop was just starting, and here were a nice lot of *Crotons*, fine young stuff of good colour, and seemingly very promising. The back wall of this house is completely covered with *Ficus repens*.

In the early vinery are such varieties as Black Hamburgh, Foster's Seedling, and Duchess of Buccleuch. The Vines, though somewhat old, are wonderfully full of vitality, the wood being hard and well ripened. The greenhouse is another good house, containing a large variety of double and semi-double *Pelargoniums*, *Begonias*, and other plants. On the roof there is a very fine *Passiflora* in flower; a *Bougainvillea glabra* with a profusion of very fine sprays, well worth photographing; a *Niphetos* Rose, nicely flowered; and then comes the late vinery, with a grand crop of Black Maroc, Black Hamburgh, Black Alicante, and Lady Downe's Grapes. There are some nice bunches of fleshy

berries, well coloured, with evident signs of careful culture. In the Peach house are the varieties Royal George, Dr. Hogg, and Gros Mignonne, with *Violette Hâtive Nectarine*. In two span-roof houses are some fine *Coleus*, a fine lot of *Calanthe Veitchi* (good bulbs, showing well), *Dendrobium*, *Cypripedium*, and *Cœlogynes*, besides *Pancreatium fragrans*. These are now almost bursting their 10in pots. In the frame-ground are *Cinerarias*, looking well; about 500 pots of Strawberries for forcing, *Primulas*, *Cyclamens*, and *Eucharis amazonica*.

The hardy fruit garden (and they know how to grow fruit at Woodhall) comprises Pears, a treat to look upon, easily over a pound in weight, and not solitary ones, but quite numerous. Catillac had a fair crop, and all were good fruit, probably averaging  $\frac{3}{4}$ lb, with perhaps 100 or 150 on a wall tree. Durondeau also had a fair crop of magnificent fruits. Pitmaston Duchess, Beurré Rance, Duchesse d'Angoulême, and Winter Crasanne were all good. The trees are exceedingly well trained.

Of Apples, we saw a fruit of Warner's King, which had been blown down by the wind. It was 13½in in circumference, and weighed over a pound; and we believe some fruits of this past season weighed 25oz. (It may be remembered that the late Mr. Woodcock wrote of the fruit here in the "Journal" a few years ago.) Gloria Mundi, Ribston Pippin, Kentish Fillbasket, Bramley's Seedling, Blenheim Orange, Lane's Prince Albert, Lady Henniker, Cox's Orange, and King of Pippins, all do well, and Mr. Lewendon's culture is evidently successful. Amongst the shrubs we observed Golden Elder and *Thuopsis* doing particularly well.

The gardener's house itself claimed some attention. It is a modern structure, covered with *Ampelopsis*, just then turning to that lovely hue that betokens the approach of autumn. It was what town folk would call a lonely situation, but pleasant withal; and its appearance was in keeping with the rest of the establishment, for everywhere tidiness and good order were apparent, and when next business takes us in the neighbourhood we hope to have the privilege of renewing the acquaintance. —ROVER.

## Some Good Roses.

That our national flower is more popular than ever, is proved by the fact that each season brings us quite a large number of new varieties of exquisite shades and delicate tints, each in its way an improvement on the many beautiful sorts we possess. One often remarks, "Surely nothing more beautiful is possible?" on seeing a new introduction at one of the numerous Rose shows, only to repeat it again at a subsequent exhibition. Amongst the many superb varieties exhibited this season few can have failed to notice massive, beautifully shaped blossoms of Frau Carl Druschki. It is indeed an acquisition, and the snow-white blossoms are deserving of the popularity this Rose has gained.

Another striking flower, the magnificent silvery-white Mildred Grant and Mrs. Edw. Mawley, a deliciously scented Tea, bright carmine in colour, shaded salmon, is to be seen in nearly every collection. A beautifully coloured Tea Rose is Lady Roberts, of a rich reddish apricot, varying at times, pale orange at edge of petals, rich red copper colour at the base. Undoubtedly it will demand a foremost place, being one of those charming Roses that appeal to all tastes.

Among the many velvety-crimsons we have to select from, none, perhaps, are more worthy of first choice than Liberty, for it is perfect in form, medium size, and decided in hue. As a cut flower or for a buttonhole it will equal any other, while a good bunch is exquisite, its richness being indescribable. Bessie Brown is the best creamy white variety one could choose, and is a perfect flower. Gladys Harkness, a sweetly scented Tea Rose, very free flowering, of a deep salmon colour, should have a place, and the long pointed buds of Lady Battersea are exceedingly attractive, making a splendid buttonhole flower. Its colour is a very pleasing shade of cherry-red. For a good yellow I can recommend Souvenir de Pierre Notting, a charming soft yellow, most delicately tinted with pink. An indispensable Rose is Duchess of Portland, being one of those useful varieties suitable for all purposes. The colour is pale sulphur yellow, the form of flower perfect. Killarney, flesh shaded white, delicately tinted pale pink, is a Rose already popular. The buds are long and pointed, in this stage of its growth being exceedingly lovely. To complete the dozen I will conclude with Lady Mary Beauclerc, a rich madder Rose in colour, with silvery reflexes. It is a massive Rose of striking appearance, ideal in form, and sturdy in habit. —OSWALDSTREE.

A PIT-MASON DUCHESS.—A correspondent who noticed our excerpt from a provincial paper (page 522) bewails our want of knowledge. "Of course the well-known Pitmaston Duchess is meant," he says, "and not Pit-Mason, a lapse that should not occur in your columns." We think our correspondent has yet to undergo the surgical operation suggested by Sidney Smith for Scotsmen, in order that they might see jokes. (Our correspondent is English!) We thought the "Pit-Mason Duchess" quite funny enough to smile at; and may gardeners not smile?

### Profitable Varieties of Bush Apples.

(Continued from page 517.)

A comparatively new Apple, though still outside the thirty year limit previously mentioned, is Lord Burghley, which was raised in the gardens of the Marquis of Exeter at Burghley, near Stamford, and first fruited in 1865. The fruit is of medium size, golden yellow with red on one side, and is slightly angular. It is very tender and juicy, with somewhat of a Pine flavour. It is a sturdy upright grower, though it does not make a very large tree; in fact, is said to be unsuitable for standards. It has received a First-class Certificate from the Royal Horticultural Society, but is not very widely grown yet, not having been boomed like some, and is not so frequently seen on the exhibition table as one would expect, considering that it is both handsome, good, and prolific. It is in season from January to May, and should be allowed to hang late like Sturmer Pippin. The later it hangs the firmer in texture, and consequently juicier, it will be in the spring, when it is much appreciated. I may seem to be departing from the opinions expressed above in advocating a comparatively new Apple: but this is one I am growing myself, and I am very pleased with it. A writer in one of the gardening papers lately asked why people grew the small Old Nonpareil, when there were such Apples as Sturmer Pippin, Lord Burghley, and Duke of Devonshire, all as good in flavour, as firm in texture, and as late or later, with the great advantage of being considerably larger.

#### ADAMS' PEARMAN.

As a contrast to the recent origin of Lord Burghley may be mentioned Adams' Pearmain. It is of real Pearmain shape, that is, smaller at the top than at the stalk. The term Pearmain, which is applied to so many Apples, is said to be from the Latin words *Pyrus magna* (great Pear), because the shape bears some resemblance to an inverted Pear. It is a handsome scarlet fruit when it gets enough sun. Of fine flavour, and a good addition to the Christmas dessert, lasting well into the spring. At Covent Garden I have seen it selling at 10s. a bushel in March and April. The growth is slender and upright, and forms a most prolific bush, bearing fruit at two or three years old. It has peculiar spoon-shaped leaves, which make it easily recognisable even without fruit upon it. It should be only lightly pruned.

#### FEARN'S PIPPIN.

I will now mention two Apples that are equally good for dessert or culinary purposes. One is Fearn's Pippin, a bright red Apple of medium size, a compact upright grower, and abundant bearer. Its beautiful colour and medium size proclaim it essentially a dessert Apple. Its good looks cause it to be one of the most popular Apples in the streets of London, where it is, however, of nothing like the flavour it is when allowed to mature on the tree and then properly stored. It is at its best in January or February, when it is brisk and refreshing, getting sweeter later. It may be given a couple of feet less space than the other double purpose Apple, namely, Dutch Mignonne.

#### DUTCH MIGNONNE.

This, though compact, is much branched and spreading in its growth, instead of upright like the preceding. The tree is quite remarkable for the thickness with which the shoots are set with fruit-buds, and I have seen trees literally so clothed with fruit that scarcely any wood could be seen, except the stem. The fruit is rather large if not too thick, handsome, very hard, and good for dessert in some seasons until May. Dr. Hogg says: "It is a very valuable and delicious dessert Apple, well adapted for dwarf or espalier training."

#### STIRLING CASTLE.

In addition to these two double-purpose Apples, three purely cooking Apples must be given. The first is Stirling Castle, so called because it was raised at Stirling about 1830. It is a fairly large Apple, at its best in October or early November, and is an enormous bearer—so much so, in fact, that on the Paradise it does not make sufficient growth, and should in consequence be grown on the Crab stock. Even then it needs liberal treatment to perfect its heavy crop, as there is no fear of its ever growing too strong. Early in the season it is beautifully crisp and acid, and if an Apple is wanted in September to mix with Blackberries or Plums for preserving, none more suitable could be selected.

#### LANE'S PRINCE ALBERT

is another, it may almost be said, immoderate bearer, and for that reason should be on the Crab stock. It is a large Apple, perfectly round, and is good till April, in which month it is very fair for

dessert if well matured in the autumn. Dr. Hogg describes it as "A marvellous bearer." It is a curious instance of an Apple being neglected for many years and then discovered, as this Apple was raised by Messrs. Lane and Son, of Berkhamstead, and first exhibited in 1857. This and the preceding variety will, if liberally treated, give the largest quantity of Apples off a given space of ground. Both often need thinning to get large fruit, both have a rather pendulous habit of growth, and this is intensified by the great weight of fruit the branches bear. On this account what little pruning either of these two varieties need should be to a bud pointing upwards, so as to counteract in some small measure the drooping tendency. These two varieties alone are sufficient to supply the kitchen for the autumn, winter, and early spring. Stirling Castle being ready for use the beginning of September, or earlier, and Prince Albert lasting almost to May.—A. PETTS.

### Cordon Gooseberries and Currants.

Red Currants and Gooseberries are such prolific and regular cropping fruits that no private garden should be without them, and, indeed, there are but few in which they are not grown. The bush form of growing both is the one usually adopted, and excellent results are undoubtedly obtained from that form of tree, but under some circumstances cordon trees have so many advantages that I wish to draw particular attention to their merits, without in any way deprecating the value of bushes.

In some gardens very little room can be spared for Gooseberries and Currants, and in such cases I unhesitatingly say that cordons are a real boon, because by their use a number of varieties can be grown in a limited space; and it is an open question whether or not a greater amount of fruit can be obtained from a given area by employing cordons than by planting any other form of tree. Fences formed of Gooseberries and Currants also make admirable screens, and considering how frequently it is necessary, even in a moderate-sized garden, to break up the space into numerous divisions, there are certainly hosts of opportunities of turning cordons to good account. Where north or west walls can be spared for the purpose, splendid crops of fruit can be grown upon them, which, if netted, may be kept very late, and at all times fruit grown on cordons can be more easily protected from birds than when grown on bushes.

To my mind one of the greatest blemishes to be seen in connection with allotments is the irregularity in which bush fruits are dotted about with a total disregard for order, and in such cases a few lines of cordon trees would certainly look much better, and also be capable of producing a greater weight of fruit without impeding the performance of work connected with vegetable growing.

Fences five feet in height answer admirably, and it is not a very expensive business to erect these with iron uprights and galvanised wires, although a cheaper fence can be formed by using wood and wire. In all instances one foot apart answers for the wires.

Before planting, the soil should, of course, be trenched; and if it is deep and rich, no dung should be given, as it will only tend to make trees grow very strongly. Basic slag or superphosphate may, however, with advantage be mixed with the upper spit at the rate of 6ozs per yard. On poor soils I certainly recommend that some well-decayed manure be incorporated with the lower strata, and the surface be mulched after planting.

For Gooseberries, I prefer single to double cordons. Two year old trees answer well, and these should be planted one foot asunder. Avoid planting when the soil is wet, and tread it firmly. Early in spring, cut the side shoots to within one bud of their base, and shorten the central one by a half or one-third its length, according to the strength of each. The subsequent management is quite simple, and consists of pinching the side shoots at the fourth or fifth leaf in summer, and cutting back to two eyes at the spring pruning. The central leader needs only an inch or two removed at the point each year, unless it is weak and thin, then harder pruning must be practised until vigour is secured. When the upper wire is reached treat the leader exactly the same as the side shoots.

Double cordons answer better than single ones for Currants, for when they are grown in the latter form, on deep, rich soils, they often grow too strongly to be fruitful. What the Red Currant delights in is a soil freely intermixed with stones. Its roots are then very fibrous, the growth made is sturdy and fruitful, and when heavy crops are grown, plenty of feeding may be given without fear of strong, unfruitful wood as a result. Those who have deep soils, and find their Red Currants inclined to grow too strongly, should try the effect of a heavy dressing of basic slag.

With regard to pruning, the cordon Currant should be treated in a similar way to that described above for Gooseberries, with this exception—the leaders usually require a little more shortening to induce them to send out plenty of side shoots to form spurs. The double cordons should, of course, be planted 2ft apart, and the following are excellent varieties to plant:—

GOOSEBERRIES.—Red: Crown Bob, Keen's Seedling, Lancashire

Lad, Warrington, Whinham's Industry, Dan's Mistake, Plough-boy. *Yellow*: Early Sulphur, Golden Drop, Yellow Amber, Leveller, Ringer, Green and White, Whitesmith, Langley Beauty, Antagonist, Plunder, Thunder.

**CURRENTS.**—Comet (new), La Fertile, Raby Castle, Fay's Prolific, White Leviathan, White Versailles.—H. D.

### Apple, Yorkshire Greening.

It would be interesting to know why so many fruit-growers omit the name of this variety from their catalogues, for though the tree is a rambling grower, yet the fruits are good for culinary purposes, and in use from October to January. It is best as a bush for small gardens, and is favoured in certain districts, but of course, Ribston Pippin, or Newton Wonder, are much more generally utilised. Yorkshire Greening is a large Apple, rather flat and slightly angular, dark green in colour, and flushed and striped with red on the sunny side, and heavily speckled all over with grey russet.

## Societies.

### Essay on the Grape-Vine at Hull.

The Hull and District Horticultural Association held its third meeting of the winter session at the Imperial Hotel, Paragon Street, on December 1st, Mr. J. P. Leadbetter, of Tranby Croft, in the chair, when Mr. Allsop, of Dalton Holme, read his paper on the Cultivation of the Grape Vine. Dealing with the matter in point of chronological order, he first spoke of the great antiquity of the Vine, and alluded to several verses of the Bible in which it was spoken of. Coming nearer home, its history in Britain was lightly traced and brought up to our own times. Mr. Allsop then struck what might be considered the keynote of his essay: for he rightly attaches paramount importance to the atmosphere of a vinery. It was pointed out that in keeping the atmosphere in a correct state as regards moisture, freshness, and buoyancy from the time the Vines were started until the bunches were cut, and even until they were started again, was the most important item in successful cultivation. The essayist then proceeded to detail his method of forcing, and attached great importance to the syringing. He gave it likewise as his opinion that shanking was more often due to dryness of the border than attributable to the roots breaking into a bad subsoil. The border should always be kept moist, and some food given to it at every other watering. Mr. Allsop favoured the lean-to form of structure, but spoke of the span-roof as being admirable for late Vines. The border he advised to be made of two-thirds loam, freshly cut, the remaining one-third to be composed of lime rubble, charcoal, bones, wood ashes and soot. A detail which cannot be too strongly emphasised is that the wires on which the rods are trained be from 20 to 24 inches from the glass, thus allowing plenty of room for the development of healthy foliage, and also to minimise the danger of scalding. The varieties said to be the best for keeping were Lady Downe's Seedling, Gros Colman, Black Alicante, Muscat of Alexandria, and Mrs. Pearson. The essayist then gave an account of the three most troublesome insects, red spider, mealy-bug, and thrips, and described remedies. The asking of questions appeared to be greatly enjoyed by Mr. Allsop, as well as by the members. Several were put, and evoked answers abounding in wisdom, and clearly based on good practical experience. A hearty vote of thanks was accorded.—W. R.

### National Chrysanthemum, Crystal Palace,

DECEMBER 8TH AND 9TH.

The last show of the National Chrysanthemum Society for the year was held on Tuesday last, and, if due consideration be taken of the weather, the show might be classed as up to the average, though greater competition was required in most classes. The trade exhibits were numerous, and made an excellent display. The premier class was that for twenty-four Japs (eighteen varieties), but there were only two competitors. Mr. J. Simon, gardener to W. W. Mann, Esq., Ravenswood, Bexley, led. The varieties employed were Mrs. E. Thirkell, Dorothy Pywell, Marquise V. Venosta, Madame R. Cadbury, G. J. Warren, Madame Carnot, Aeme, Mrs. F. Grimwade, Duchess of Sutherland, Mrs. J. Bryant, Henry Barnes, Queen Alexandra, Mrs. J. C. Neville, Henry Stowe, Florence Molyneux, Nellie Bean, Mons. Chenon de Léché, and C. J. Mee. Mr. G. Hunt, gardener to P. Ralli, Esq., Ashted Park, Epsom, was second, with good blooms of F. W. Vallis, Dorothy Pywell, Countess of Harrowby, Bessie Godfrey, and C. J. Mee. In the class for twelve Japs three contested, all of fair quality. Mr. W. Jinks, gardener to L. J. Drew,

Esq., Knowle Green House, Staines, was first, who staged W. H. Whitehouse, Guy Hamilton, Madame P. Radaelli, May Inglis, Mrs. E. Thirkell, a seedling, Loveliness, Mrs. F. Grimwade, Mrs. Barkley, M. L. Remy, Chas. Penford, and Mrs. Weeks. Mr. G. Hunt followed with good blooms, while Mr. J. Simon made a very good 3rd. There were again three entries in the class for 6 distinct Japs, Mr. W. Jinks proving an easy victor. The 2nd prize was won by Mr. W. G. Prudden-Clark, York Road, Hitchin, while Mr. Shipway, The Grange, Sutton, was 3rd.

The class for 12 incurveds (6 varieties) was represented by two exhibitors. Mr. J. Simon was deservedly awarded 1st with Frank Hammond, Duchess of Fife, Ialine, Ralph Hatton, Bonnie Dundee, Snowdrift, and Mrs. F. Judson. Mr. G. Hunt was a close 2nd, his best blooms being Mdle. L. Faure, Mrs. E. Seward, Frank Hammond, and May Bell. The class for 24 bunches of Chrysanthemums in vases only brought out one competitor, Mr. G. Hunt, who made a good display. Mr. G. Hunt was the only exhibitor in the class for 12 vases of Japs. Mr. W. C. Pagram was the only representative for 6 bunches of large flowering single varieties. The varieties were Mrs. Roberts, Duchess Elizabeth, Framfield Beauty, Golden Star, Edith Pagram, and Sylvia. The small flowered single varieties only induced one competitor to stage—Mr. W. C. Pagram, with Ox-eye, Scarlet Gem, Mrs. Langtry, Madge, Cannell's Gem, and Terra-cotta.

There were but two groups of Chrysanthemums and miscellaneous plants. First, Mr. W. Howe, Streatham Common. Chrysanthemums, however, played quite a minor part, the chief features being Poinsettias, Begonias, Palms, Crotons, and Asparagus Sprengeri, which were well grown and beautifully displayed. Mr. R. Forster, Nunhead Cemetery, was 2nd with a group of Chrysanthemums arranged with Asparagus, Palms and Ferns.

The six flowering Begonias were represented by two entries, the first prize being taken by Mr. H. Perkins, gr. to the Hon. W. F. D. Smith, Greenlands, Henley-on-Thames, who staged grand plants of Gloire de Lorraine. Mr. W. Howe followed, and he was the only exhibitor who staged a table of flowering and berried plants.

For 6 bunches of decorative, spidery, or thread-petalled Chrysanthemums there were three entries, and the 1st prize was well won by Mr. Charles Brown,

Apple, Yorkshire Greening.

gr. to R. Henty, Esq., Langley House, Abbots Langley; the varieties were Mrs. Filkins, Cannell's Favourite, Sam Caswell, and Arab. Mr. W. C. Pagram made a capital 2nd; while Mr. A. Taylor, East Finchley, brought up the rear. For 6 bunches, any varieties, there were but two entries, Mr. W. G. P. Clark coming out 1st with Lady Roberts, Madame Herrewége, Mrs. Barkley, Edith Pilkington and Godfrey's Pride. The exhibit was praiseworthy for the time of the year. Mr. E. E. Horsey, Goffs Oak, Cheshunt, was a poor 2nd.

#### Floral Committee.

There was a good attendance of members present, and the same feeling pervaded their awards on this occasion as has been so clearly manifested this season. Several novelties were placed before them, but only two awards were made. *Souvenir de William Clibran* (Clibrans), a good white, incurved variety of fine form and petal: already in commerce.—(F.C.C.). *Allman's Yellow* (T. Allman), a fine December decorative variety, rich golden yellow, of the Tuxedo type; will make a fine market variety.—(F.C.C.)

**MISCELLANEOUS EXHIBITS.**—The finest display of the whole show was the exhibit from Mr. H. J. Jones, Ryecroft Nursery, Lewisham. The varieties were arranged separately in huge vases with appropriate foliage. The best were Dorothy Pywell, Snow-drift, Viscountess Cranbourne, Madame P. Radaelli, A. J. Foster and General Hutton. The late flowering thread-petalled varieties were much in evidence, while the display, taken as a whole, was perhaps Mr. Jones' best effort in December.

Mr. Norman Davis, Framfield, Sussex, contributed a nice group arranged on the ground floor, the best varieties being Madame Paolo Radaelli in grand form, General Hutton, J. R. Upton, Western King, G. J. Warren, and Lady Violet Beaumont.

Mr. H. Perkins arranged a large table of Begonias.

Messrs. Clibran and Son, Altrincham, made a bold display of single Chrysanthemums, and they had a few good decorative varieties. A few of the best were Mrs. E. Roberts, Mrs. F. K. Charlton, Blowden Jones, and Miss Beattie Rowden. Mr. R. Forster, Nunhead Cemetery, had a fine semi-circular group of Chrysanthemums.

Apples were represented by Messrs. J. Cheal and Sons, Crawley, who had a goodly display of dishes. The best were Allington Pippin, Emperor Alexander, Newton Wonder, Jubilee, Bismarck, and Cox's Pomona.

Messrs. W. Cutbush and Sons, Highgate, made an interesting exhibit of Carnations in vases, the chief being Mrs. S. J. Brooks (undoubtedly the best white), Mrs. T. W. Lawson, and W. H. Cutbush.

The firm of Messrs. H. Cannell and Sons, Swanley, made a bold display of large plants of Begonia Gloire de Lorraine, also an unique exhibit of Zonal Pelargoniums, in which were noted Fred Bean, Duke of Norfolk, The Mikado, Duke of Bedford, Lord Roberts, Lady E. Malet, and Winston Churchill. Chrysanthemums were represented by a good collection of the late decorative varieties, also a good display of exhibition blooms.

Messrs. J. Peed and Son, West Norwood, made a fine display of Chrysanthemums arranged with Palms, Dracenas, Crotons, and Asparagus Sprengerii. The chief Chrysanthemum flowers were Madame R. Cadbury, Etoile de Lyon, Miss Jessie Cottey, Mrs. Filkins, and Mrs. Barkley.

#### National Sweet Pea—Annual General Meeting.

**SUMMARY.**—Mr. Henry Eckford to be president; Mr. Whitpaine Nutting, chairman of committee; keen discussion on the question of judges, the Trade to be represented in that capacity. In the staging of flowers, part of the vine or haulm of the Pea to be allowed. Provincial shows proposed. London show at Earl's Court. The Society has a balance of £30 8s.

The annual general meeting was held at the Hotel Windsor, London, on Tuesday last, about a score being present. The meeting lasted 1½ hours. The following report and balance sheet for 1903, as follows, were adopted unanimously:

"In presenting to the members of the Society the third annual report, the committee is gratified that it should be so satisfactory. The past season has been the most important in the Society's brief history. The controversy, which arose out of your committee's action in regard to the judges for the last exhibition, was fortunately only momentarily, and the arrangements for 1904 will be submitted to the committee. The past summer was wet and cool, with the result that Sweet Peas flourished grandly, though the coldness of the spring put a severe handicap upon the plants in their early stages. In many places the plants attained to the exceptional height of ten feet, and produced flowers which were remarkable alike for colour, size and substance. The exhibition held in Prince's Hall, Earl's Court, was a magnificent success, and your committee's only regret is that the exhibition authorities failed to adequately advertise the gathering. Apart from this, the authorities were most courteous, and did all they could to make the exhibition a success. The thanks of the Society are specially due in this

matter to Henry Hartly, Esq., the managing director, and to Mr. Bond, the clerk of the works. The exhibition was so extensive that it was found imperative to remove the barrier at the one end of the large hall with a view to securing an extra 360 square feet of space, and even then the tables were in some places a trifle crowded. The general effect of the show was excellent, though a little flatness was apparent in the centre tables. This your committee will endeavour to overcome at future exhibitions, as it is very desirable that every advantage should be taken of the excellence of Sweet Peas for decorative effects.

"In 1902, the Society conducted a classification of Sweet Peas, and it was thought that this might be annually revised. At a meeting of your committee held on June 9, it was, however, considered that an audit of the varieties shown would be valuable, as indicating the best sorts to grow, and the honorary secretary was instructed to arrange for this. Mr. Charles H. Curtis was eventually requested to undertake this decidedly onerous task, and the results of his labours are set forth in the schedule. The tabulations show to what a remarkable degree the classification of the previous year was correct, as the present audit substantiates it in all salient points. Your committee would especially commend this audit to the Trade, to whom it is bound to prove of immense assistance in determining the varieties most worthy of retention in catalogues; and it would also draw the attention of cultivators to the 'colour list' in the audit, as this is certainly a list of the very best varieties. Your committee would again draw the attention of members to the properties of the Sweet Pea. [These have been printed frequently in the *Journal*, and are therefore omitted now.—ED.] Upon the completion of the judging on the first day of the exhibition, the committee met to consider the merits of the new varieties, of which some two or three dozen were shown. First-class certificates were awarded to Florence Molyneux (Dobbie and Co. and E. Molyneux), Cupid Her Majesty, and Cupid Lottie Eckford (H. Cannell and Sons), Scarlet Gem and King Edward VII. (Henry Eckford). The following varieties were highly commended:—Cupid Mrs. J. Chamberlain, Cupid Royalty, and Cupid Captain of the Blues (H. Cannell and Sons), Bolton's Pink (R. Bolton). Mr. John Ingman, from Mr. Silas Cole, the committee desired to see again. The silver medal of the Society for the finest novelty of the year was unanimously awarded to Scarlet Gem, which, although in some cases having only two blossoms on a stem, was so remarkable in colour as to bring it well within the scope of the last clause in the 'Properties of the Sweet Pea.' The financial position of the Society is satisfactory, for, notwithstanding the fact that the expenses at the show were slightly greater, the balance at the bank is rather higher than last year. The support given by the Trade was most excellent, and your thanks are due to those who gave special prizes, as well as to the many friends who helped with annual subscriptions. The number of members again shows a substantial increase. The thanks of the Society are especially due to Mr. Charles E. Shea and Mr. George Gordon, V.M.H., President, for the assistance they rendered in adjudicating upon the several splendid exhibits contributed by the Trade. Their awards were: A large Gold Medal to Messrs. Hobbies, Ltd., Dereham; Gold Medals to Messrs. C. W. Breadmore, Winchester, and H. Cannell and Sons, Swanley; Silver-gilt Medals to Messrs. Dobbie and Co., Rothesay, and Henry Eckford, Wem; large Silver Medal to Messrs. Jones and Son, Shrewsbury; Silver Medal to Messrs. E. W. King and Co., Coggeshall; and a small Silver Medal to Mr. J. Williams, Ealing. Your thanks are also due to Mr. Cecil W. Greenwood for invaluable assistance rendered to the honorary secretary in the management of the show, and also to the several members of the committee who acted as stewards."

Examined as per vouchers, &c., and found correct.—C. W. GREENWOOD.

Following the adoption of the foregoing report, the retiring president proposed Mr. Henry Eckford, of Wem, for that office. Mr. Robert Sydenham (Birmingham) seconded. Mr. Gordon has been president ever since the society's foundation, and greatly to his devotion is its success due. He stated, by way of explaining his discontinuance in the office, that he thought it was good for no society that the president should consider his office a "freehold." Mr. S. B. Dicks (of Cooper, Taber and Co.), on retiring from the chairmanship of committee, proposed Mr. Whitpain Nutting for the post, and Mr. C. E. Greenwood seconded. The propositions were unanimously agreed to, and the retiring officers were heartily thanked. The hon. treasurer (Mr. N. N. Sherwood), and the hon. secretary were each re-elected, the latter (Mr. Horace J. Wright) receiving an honorarium of ten guineas. It was also agreed to award two guineas to Mr. C. E. Greenwood, for his invaluable assistance at the show and at other times. The committee was re-elected, and Messrs. Geo. Gordon, C. W. Breadmore (Winchester), G. Crabbe (Addlestone), and John Green (Dereham) were added. Messrs. W. P. Wright, J. F. McLeod, and Richard Dean retire.

Mr. S. B. Dicks proposed and Mr. C. H. Curtis seconded, that the desirability of holding provincial shows be brought before the committee, and that this body be instructed to try and make arrangements with provincial societies at whose shows the National Sweet Pea Society, would offer prizes, and would have the control of the section devoted to Sweet Peas. Places mentioned were Wolverhampton and Shrewsbury. The meeting unanimously agreed. Regarding the dates of the London Show, after some discussion it was agreed to leave the matter with the committee, who were instructed to fix dates as near to those of the past show as possible (June 15 and 16). The difficulty was that Holland House Show and the Temple Rose Show happen about the same time.

Mr. W. Cuthbertson (Dobbie and Co.), of Rothesay, N.B., now brought forward the question of the exclusion of Trade growers from acting as judges. He wished the matter to be discussed in a purely friendly spirit, and thought that there was no reason why they should be debarred. He suggested that experts in the Trade be appointed as judges, along with amateur and professional gardeners. Mr. James C. House, of Westbury-on-Trym, near Bristol, supported Mr. Cuthbertson. He thought the executive committee had not met the wishes of the society's best supporters. He assured those present that there was a strong feeling in the Trade on this point, and it extended all over the country. He knew the arguments of the committee. They were: That by inviting amateurs to judge, they became more and more enthusiastic growers of the Sweet Pea. Mr. House thought, however, that the best way to popularise the Sweet Pea was to first make the seedsmen take a real interest in the flower, and their customers will do so too. Since he himself, in his own business, took to cultivating Sedums and some other humble plants, the amateurs around him had likewise grown interested in these plants. He would second any proposal that representatives of the Trade be included in the judges' roll and be allowed to adjudicate novelties. Mr. John Green (Dereham) suggested that one-third of the judges be amateurs, one-third professionals, and one-third trade growers.

Mr. Geo. Gordon, chairman, intervened, saying that the letters to the papers had been utterly unjustified. The committee had not had the merest intention of slighting the Trade, but they had deemed it advisable not to appoint representatives therefrom, so as to avoid any suspicion of favouritism on the part of the committee. He pointed out that the Trade were actually in the majority on the committee, and that being so, it should be impossible, he thought, to do anything against the interests of seedsmen.

Mr. Robert Sydenham did not doubt that the committee wished to meet the wishes of its supporters, but there should be no loop-hole of uncertainty, and by accepting the proposal before them they would get over any chance of serious friction. He supported Mr. Cuthbertson, as did Mr. Dicks.

Mr. C. H. Curtis, "as the originator of the whole trouble," explained in objecting to Trade judges, he had simply suggested that precedent be followed. Mr. Gordon said that in view of what had taken place, he hoped the committee would appoint Trade judges. The proposition, as follows, was carried without a dissentient: "That the general committee be instructed to select the judges in equal numbers from Trade, professional, and amateur gardeners."

Mr. House raised the question as to how Sweet Peas should be shown, for though their own foliage is allowed in bouquets, yet there had been disqualifications in the provinces, of exhibitors who had staged trusses of flowers attached to the haulm (or vine). He suggested that part of the vine be allowed, but, of course, only one flower truss. The matter was referred to the committee.

#### Erica propendens.

This beautiful, bright mauve-pink flowered Erica received a first-class certificate some years ago when shown at a R.H.S. meeting by J. Veitch and Sons, Ltd. It is a charming spring and summer-flowering subject for the greenhouse.

## County Council Instruction: Horticulture.

(Concluded from page 516.)

This concluding instalment records what the County Councils of Scotland, Wales, and Ireland are doing, or have done. It is somewhat remarkable that Scotland should have so few instructors. In order to make the English list complete we may add, what all "Journal" readers know, however, that Middlesex has an experimental garden at Pymmes Park, Edmonton, under the care of Mr. J. Weathers; the Isle of Wight has a garden at Newport, superintended by Mr. Charles Martin; and Oxfordshire has practice plots, under the direction of Mr. S. Heaton.

#### SCOTLAND.

EDINBURGH AND EAST OF SCOTLAND COLLEGE OF AGRICULTURE.—We do not have a permanent Horticultural Lecturer on our staff, but employ, for short courses, Dr. J. H. Wilson, St. Andrew's University

Erica propendens. (Nat. size.)

and the Rev. G. D. Hutton, M.A., B.Sc., The Manse, Bothkennar-by-Carron. They are both capable lecturers, as well as thoroughly practical men. The other lecturer we had, Mr. Wm. Williamson, gardener, Warriston, Edinburgh, was formerly gardener at Turrit House.—WM. SCOTT STEVENSON.

WEST OF SCOTLAND AGRICULTURAL COLLEGE.—Professor N. A. McAlpine, B.Sc., is our College Lecturer on the Principles of Horticulture. Mr. J. Muir, F.R.H.S., is an occasional member of the staff, and is engaged as occasion requires for work in the counties.—JOHN CUTHBERTSON, Blythswood Square, Glasgow.

#### WALES.

BRECKNOCKSHIRE has not appointed an instructor.

CARDIGANSHIRE.—The County Council have not a regular Instructor in Horticulture in their employ. They make use of the Instructor

in the service of the University College of Wales, Aberystwyth, Mr. John L. Pickard, who gives courses of instruction and demonstrations at centres in the County, fixed each year, extending over from ten to fourteen days. He also holds summer classes at the College open to schoolmasters and mistresses, to whom the Council makes grants towards their expenses. We find this a more satisfactory course than appointing an instructor of our own.—H. C. FRYER, Clerk of the Council, Aberystwyth.

CARMARTHEN.—Our Instructor is Mr. Pickard, University College of Wales, Aberystwyth. We have no experimental garden.—J. W. NICHOLAS, County Education Offices, Shire Hall, Carmarthen.

DENBIGHSHIRE County Council has no Instructor in Horticulture and no experimental gardens.—W. R. EVANS, Clerk of the County Council, County Offices, 5, Castle Street, Ruthin.

FLINTSHIRE.—I beg to say that we have no teachers of horticulture appointed directly by the County Council. A grant of £250 a year is made to the University College, Bangor, for the teaching of several branches of agriculture, to which, I believe, horticulture has been added recently. I would advise you to write for further information to Professor Thos. Winter, of the Agricultural Department, North Wales University College, Bangor.—P. MOSTYN WILLIAMS, Rhyl.

GLAMORGANSHIRE.—No Horticultural Instructor has been appointed in this county.

MONTGOMERY.—The Montgomeryshire County Council have not appointed any Instructor in Horticulture.—GEO. D. HARRISON, Welshpool.

PEMBROKESHIRE.—The Technical Instruction Committee have twice engaged the services of Mr. Pickard, of the University College, Aberystwyth, to give lectures and demonstrations in horticulture, but no permanent instructor has been appointed.—WM. DAVIES GEORGE, Haverfordwest.

RADNORSHIRE.—No Instructor in Horticulture is appointed by the Radnor County Council, nor is there any experimental garden.—J. W. VAUGHAN.

#### IRELAND.

We furnish only the names of those counties where an instructor is appointed. All the others have as yet no horticultural teachers.

CARLOW.—Our Committee have not as yet appointed an Instructor in Horticulture, but the department have decided on sending down Mr. Orr, their own inspector, to deliver a course of lectures in this county. As yet no proper garden has been laid out.—P. J. GRIFFIN.

CAVAN.—Just at present my Committee are without such an instructor, the department having refused to sanction the appointment of our last; but we hope to make a fresh appointment in November, when I may forward name to you.—JOSEPH P. GANNON, Erskine House, Cavan.

CORK.—Replying to yours of 25th October, we have appointed during the past two years Mr. James Blemens, Blackrock, Cork, Instructor in Horticulture and Bee-keeping.—J. T. CARROLL, Sec., Court House, Cork.

GALWAY.—Instructor in Horticulture and Bee-keeping, Mr. John Meade, Committee of Agriculture, County Court House, Galway.

WEXFORD.—The Horticultural Instructor (itinerant) is Mr. Thos. Scott, Court House, Wexford.

WICKLOW.—Our Instructor in Horticulture is Mr. P. J. Kane. His letters should be sent c/o the Secretary, Court House, Wicklow.—P. T. HEALY, Sec.

MONAGHAN.—Mr. John Toner is the Horticultural Instructor for this county. His address is Court House, Monaghan. There is not an experimental garden.—P. MAQUIRE, Sec.

TYRONE.—No Horticultural Instructor will be appointed for this county until the New Year.—PERCY G. DALLINGER, Court House, Omagh.

WATERFORD.—The Instructor in Horticulture is Mr. Denis Joyce, County Offices, Dungarvon, Co. Waterford. It is expected that experimental gardens will be provided this year.—JOHN BOYLE, Sec., County Offices, Dungarvon.

## Trade Note.

### A Ladderman's Belt.

When working upon ladders, all men incur the risk of falling, from one cause or another; and now that employer's liability is such a troublesome quantity, it is well to avoid danger as much as possible. Mr. Heathman, of Parsons Green, London, has produced a waist-belt with adjustable snaphook which grips any ladder rung, and in such a manner as to leave the worker free liberty of movement in his labour, even to the extent that he may turn right round and back the ladder. It is also found that a workman can rely upon the belt, and use both hands at work with far greater power than without it. For the use of gardeners in pruning and tree-lopping, where over-reaching is such a great danger, this belt should prove invaluable. The cost is only 12s. 6d., and this outlay is soon repaid by saving of workmen's time, as well as "ease of mind," afforded them.

# THE BEE-KEEPER.

## Queries for "E. E."

As a constant reader of the Journal, I am very grateful to your correspondent "E. E., Sandbach," for his excellent papers concerning bees, and which have been very useful to me. For some time back I have always been looking forward to an article by your worthy contributor with reference to the management of the bee under the hexagonal Stewarton box principle, especially as to prevention of swarming. I should, indeed, be very pleased to have "E. E.'s" views in your forthcoming issues regarding these old-fashioned (and profitable, I am told) Stewarton boxes.—HEXAGONAL.

## Wintering.

During the next month or so the apiary should be in a state of rest, requiring little attention beyond an occasional observation at the entrance in order to prevent the same being choked with dead bees or snow, and keeping the insects dry and well protected from the weather. In this country bees require some attention even during the winter; not, however, in an interfering or disturbing way, but in order to prevent the many evils consequent upon the activity unusually mild weather often causes. Sudden changes of temperature may prove as injurious to them as extreme cold; and although this is seldom heeded, it often proves disastrous, and the cause remains obscure.

In cases of snow storms it is not necessary to close the entrance of a hive, but they should be shaded to prevent the sunlight lighting up the interior of the hive and thus inducing the bees to come out for a flight, when they suddenly become chilled and fall into the snow to perish. Hives should be examined periodically, the entrance being gently raked with a hooked wire to bring forth any dead bees which may be on the floor-board. During fine, sunny days the roofs may be removed quietly and the quilts examined, and if any are found to be wet they must be removed and dry ones substituted. Take care to perform these operations without disturbance, as it will cause excitement and heat, and increased consumption of food, after which there is an equal necessity for a cleansing flight. It is, therefore, unsafe to irritate them during a long, cold spell.

Entrances should be regulated according to the number of bees inside. Warmth is absolutely necessary for their existence, as well as comfort, and if it passes away too rapidly, as in over-ventilated hives, the bees become too cold, and their vapours condense on the sides of the hive and combs, rendering the cold still more intense. The bees are consequently compelled to consume larger quantities of food, and there is an unnatural activity during the heat production. The temperature of the cluster is preserved by an increased activity of the respiratory organs of the bee, therefore anything which tends to reduce the warmth of the interior of the hive, or anything which causes them to raise it unduly, such as disturbances, is injurious. About six inches is the requisite distance for ventilation at the entrance. When spring opens they may, of course, be contracted again, and all made tight and compact to retain the heat to assist brood-rearing.—E. EATON, Sandbach.

## Young Gardeners' Domain.

### Principles of Propriety.

I have hitherto never contributed anything to your excellent paper, but I have been prompted to do so by reading in your issue of November 26 an article under the heading of "Principles of Propriety," and signed by "Scot." Now, I think in my own humble opinion, "Scot" is greatly overstepping the mark by saying that nine-tenths of the young men in England spend too much time in public-houses and pleasure seeking. Certainly this is a very grave offence for us young Englishmen to be charged with, and why should we be blamed any more than the young men in Scotland? Personally speaking, I have been engaged in the pursuits of gardening for about twelve years, and my own experience has taught me quite the reverse to that of "Scot." The largest bothy I ever lived in was one with five in it, and in that place I spent three years; and, further, I may say three happy years; and up to now I have never lived with a young man who has been too fond of spending his spare time in public-houses. I quite agree with what "Scot" says about bad language, and to my mind it is just as detestable outside a gentleman's establishment as in it.

Then he mentions smoking. Well, I think there are not many places where smoking is allowed during working hours, but he says "If one must needs smoke let him get out of sight in the shrubs for a few minutes, and have his fifteen draws." That principle I don't hold with. Does "Scot" take his snap of bread and cheese, and have it in the shrubs, or does he have it in the bothy?

If the latter place, why cannot a man go in there and have his fifteen draws, instead of having them among the shrubs during all kinds of weather? I fail to see why the one occupies more time than the other. With regard to punctuality and study, I quite agree with all that "Scot" says; but the object in penning these few lines is to try to show him that the young men in England are not quite so bad as what he makes them out to be; if so, I am pleased to say it has never fallen to my lot to live amongst them. In conclusion, I should like to ask "Scot" to give us the character of his own countrymen, as I am of opinion that if it is better than ours, it might be the means of us trying to mend our supposed evil ways. Trusting you will find space in your valuable Journal for these few modest remarks.—I am, sir, AN ENGLISH FOREMAN.

#### *Erowallia speciosa major.*

This plant forms a great addition to the flowering subjects for the warm greenhouse or intermediate house during the winter months, its intense blue coloured flowers, combined with its bright green foliage, producing a brilliant effect. The more common method of propagation is by cuttings taken annually about February or March, but much better coloured flowers on plants which bloom later in the year (a consideration) are produced from seedlings.

The seed should be sown in a light soil, in a well-drained pan, about the end of April, and placed in a temperature of about 60deg Fahr. Give a watering through a rosed can, and place a piece of glass over the pan, and keep moist. The seedlings will appear in a week or ten days, and when large enough to handle, prick them out into pans containing a light, loamy soil, and place in a position near the glass in a pit or house of the temperature indicated, and keep shaded and carefully watered until they are again growing well.

In a month or six weeks they should be large enough to transfer to small 60-sized pots, using a compost consisting of two parts loam, one of leaves, and one of sharp road grit. Water carefully for a few days until they root into the fresh soil, and when established, pinch out the tops of each to induce them to break, and throughout the growing season this must be attended to so as to form a nice bushy habit. The plants will require another shift later on, when necessary, a 5in pot being sufficient. Be careful to have good drainage, and use a similar compost to the one employed previously, only coarser, and then return to their former position and treat as before. Keep a sharp look out for red spider and thrips, and if they make their appearance, the former can be checked by the free use of the syringe, and the latter by fumigation on two consecutive nights. Cow-dung water, or guano, may be given as a food later in the year, taking care not to use too strong, and always be sure not to over-water.—E. B., South Berks.

#### *Lily of the Valley for Forcing.*

Where the expenses of the establishment will not allow of a large enough quantity of the above to be bought for forcing, a plan might be adopted for the maintenance of a supply on the same principles as carried out here. A bed, 100yds by 3yds, under the shade of a north wall, is divided into three equal portions, and at this time of the year the roots contained in one of the divisions are lifted, and sorted, and the strongest crowns, which are capable of throwing a flower spike, are placed in propagating boxes about five inches deep, in old soil saved from the potting bench, as it is not particular what they are in, as they make no fresh roots whatever whilst being forced. The smaller crowns are put aside to be dealt with presently, care being taken not to let them get dry. The boxes containing the crowns for forcing are then put in an exposed position on a bed of ashes, so as to get frozen if possible, and given a thorough soaking of water. The small crowns which were put aside are now re-planted on the same portion of the bed from which they were taken, which in the meantime should have been manured and dug.

As the boxed crowns are required they are taken into a house of a temperature of about 60deg or 65deg Fahr., where they soon throw up their flower spikes and foliage much better than the imported Berlin crowns. (It is a general rule not to force any until they have had a good sharp frost on them, as they do not start into growth so regularly.) Next year the second portion of the bed is treated in exactly the same manner, and the remaining portion the third year. By the fourth year the first portion so treated will have grown sufficiently strong to produce flowering crowns again, and by following this simple routine a supply of home-grown crowns can be procured which will give satisfactory results.—E. B., South Berks.

**MORELLO CHERRIES** should be grown wholly on the fan system, as they are more prolific in this way. The pruning of these will consist in cutting out the old bearing growths and weakened branches, reserving a fair number of the current season's growths, which lay at full length, not less than 3in apart.

#### Hardy Fruit Garden.

**WINTER PRUNING.**—There are many advantages in carrying out now the winter pruning and thus relieving the trees and bushes of superfluous wood. The foliage has all fallen, and the roots are completing their active deposition of material in the wood buds and fruit buds, and a dormant state is at hand. The work may usually be carried out under more favourable conditions than occur later, especially in the case of wall trees, when following pruning there is the training, nailing, or tying of the shoots. On damp ground, however, it will be better for the soil and more comfortable for the workmen, if boards are laid down to stand upon when operating. Slightly frosty weather renders the ground clean to tread upon, and the work can be readily done; but in the event of very hard frost the pruning of choice fruit trees should not then be attempted. From now, onwards through the month as opportunity offers, deal with wall trees and trained specimens in all parts of the garden.

**APPLES AND PEARS ON WALLS.**—As wall trees fine specimens are usually found trained horizontally, and also as cordons with upright or diagonally trained branches. It is often found that horizontal branches are too thickly placed, with the result that the trees are rendered fruitless, owing to the fact that the spurs, especially when they grow at too great a distance from the wall, shade or injure those below them. The thinning out then of crowded branches is one of the first considerations. All principal branches furnished with spurs must not be closer together than a foot. This is the minimum distance, but 15in will in many cases be much better, some varieties of Apples and Pears growing much more strongly than others, consequently the spur growths are thicker and require more room. Following upon the removal of crowded branches, the next thing should be the thinning and regulating of spurs and spur clusters. It is good policy to keep the spurs as near the wall as possible, but when crowding has been permitted of the branches, spur growths will extend unduly from the wall. Elongated spurs must, therefore, be gradually shortened back. In the case of long-neglected trees this must extend over several years if there are buds at the back which will eventually swell and form fruit buds. In some cases the more desperate remedy of shortening to within a few inches of the main branch must be adopted, relying on dormant buds to push, and eventually by culture, developing the best into fruit spurs. Ordinary pruning with many of the trees will only require the foreright or side shoots cutting back to two buds, and a few extended fruit spurs reduced here and there. Where the leading shoots have not filled up their allotted space, shorten them to the length of 1ft, or 15in if strong.

**FAN-TRAINED PLUMS AND CHERRIES.**—The advantages of this system of growing the trees are the ease with which branches can be replaced when worn out or weakened. Plums may be grown on the combined system of having branches with spurs originated on them and relays of younger wood, this usually bearing well at two years old. Even the spur-furnished branches can be readily replaced when necessary by younger and better wood. Dessert Cherries may be treated similarly. These and Plums are also amenable to horizontal training of branches on walls, and bear well when a spur system has been well established.

**CORDON GOOSEBERRIES AND CURRANTS.**—For north and east walls to produce a late crop and for espaliers in the open to produce a general supply, cordon culture of these fruits is well adapted. The chief and most abundant growths are foreright shoots, which ought to be pinched back in summer, and in winter cut to basal buds which are situated in clusters at the base. Although the general pruning of Currants and Gooseberries, especially the latter in the open, is not advisable now in view of birds taking the buds during severe weather; yet the pruning of cordons on walls may be safely done, as they rarely attack these buds. Young cordons which have yet to furnish the space allotted them must have the leading shoots shortened to about 10in so as to induce the side buds to push in spring, the growths being pinched in summer and eventually winter pruned. In the case of old trees which may require renovating, a stout shoot should be allowed to originate as near the base as possible. Train it in the direction desired alongside the old branch. Shorten in the winter to induce side buds to push, and when the lower part becomes clothed with side shoots those on the corresponding part of the old branch may be cut off. Treat another length in the same way until the new branch can take the place of the old one.—EAST KENT.

Fruit Forcing.

CUCUMBERS.—Foggy, wet, dull and cold weather, with windy and bright intervals, tax the plants severely, growth being very unsatisfactory. As every ray of light is valuable, the glass should be kept as clean as possible, both outside and inside. Not to give a check use warm sweet soil and not very wet, for earthing up the roots, covering them lightly as showing at the sides of the ridges or hillocks. A few sweetened horse droppings with an occasional sprinkling of soot spread on the surface will attract the roots and afford nourishment to the plants when watered. This is preferable to liquid manure, unless the plants are growing in very small beds, or confined to boxes or pots; then copious supplies will be necessary. Always apply it weak and tepid, and not too often, suffice that the soil be so moist as to prevent flagging. Sufficient atmospheric moisture will be secured by damping the paths and walls in the morning and afternoon of bright days; but avoid an excess, and avoid an arid condition by damping occasionally as the surfaces become dry. Look over the plants at least once a week for stopping or removing bad leaves, thinning the growths as required, but neither pinching the shoots nor reducing the growths will be much needed, yet these must not be neglected, as crowding is one of the greatest evils in the culture of winter Cucumbers.

MILDEW is sometimes troublesome at this time of the year. It may be combated by dusting the affected parts with flowers of sulphur, and the atmosphere should be kept drier. A light brushing over the hot water pipes with a cream of sulphur and skim milk is useful against mildew, red spider, and white fly. Aphides and thrips are best destroyed by fumigation with tobacco paper or vapourisation with nicotine essence. Tobacco powder dusted on green and black fly or aphides destroys them, and fumigation on two or three consecutive evenings eradicates these pests.

PEACHES AND NECTARINES: EARLIEST FORCED TREES IN POTS.—To have fruit ripe at the earliest possible time, and without overtaxing the trees by very hard forcing, they should be started without loss of time to ripen the fruit at the end of April or beginning of May. Only the very early varieties will do that, such as Alexander, Waterloo, Duchess of Cornwall, Amsden June, and Early Rivers Peaches; Cardinal, Early Rivers, and Lord Napier Nectarines. These embrace a good succession for about a month, and all are of good size, fairly grown, or not overcropped; of good colour and of first-class quality. The trees do admirably in a three-quarter span-roofed house facing south, quarter, half, and full standard trees being grown so as to have the heads near the glass. Tomatoes can be grown against the back wall for an early supply of fruit, and when the Peach and Nectarine trees go outside, the house will be at liberty for plants in pots. The trees require the same treatment as trees in borders.

EARLY FORCED PLANTED-OUT TREES.—Trees started in December, or at an early date in previous years, swell their buds promptly without excitement from artificial heat, but those forced for the first time are slower in starting into flower. To have fruit ripe in May, and the trees being of the second early and midseason varieties and not before early forced, the house must now be started. They must not be hurried, but given time to advance steadily and develop a strong flower, perfect in all its parts. The proper procedure is to admit a little air constantly at the top of the house, and above 50deg it should be advanced correspondingly with the temperature. Do not allow a decline below 50deg in the daytime, sufficient artificial heat being employed for that purpose, and with sun heat an advance may be allowed to 65deg, closing for the day before the heat has receded to below 55deg. A temperature of 40deg to 45deg is ample at night or in mild weather 50deg.

WHEN THE FLOWERS ARE ADVANCED so as to show the anthers cease syringing, but afford a moderate amount of air-moisture by damping the borders, paths, and walls in the morning and afternoon on fine days. Avoid a close moist atmosphere at any time, especially at night. Examine the inside border, making sure that there is no deficiency of moisture. If necessary afford a thorough supply of water or liquid manure to weakly trees. The surface soil is often deceptive, being kept moist by syringing, therefore supply enough to moisten the soil through to the drainage, for surface moistening does little good. Trees often have weakly blossoms, and fail to set in consequence of water being given to the tops of the trees instead of to the roots. Remember, a sodden soil is just as bad, or worse, than a dry one, therefore guard against extremes either way. If there is a superabundance of blossom buds remove those on the under side of the trellis or shoots by drawing the hand the reverse way of the growths. This will materially assist the swelling of the remaining buds. If there be any trace of aphides fumigate the house on two or three consecutive evenings. Protect the outside border with leaves and a little litter, but not so as heat, in order to keep the soil from freezing, for in such condition the roots can only imbibe soil-moisture.

SUCCESSION HOUSES.—Where the roof lights are movable it is much the best plan to remove them, and expose the

trees to the elements for the winter, the wood being thoroughly ripe. This is inimical to many insects, especially brown scale, and the trees are insured rest and thorough moistening of the border. Even latest and unheated houses are best treated in this way, often having the effect of causing the trees to retain their buds, which cast them under fixed roofs, and the blossoms are generally finer than on trees that are kept constantly evaporating from the young wood through the time they are at rest under fixed roofs, or when they are subject to alternating rests and excitements where plants are grown in the house. The fogs and damp of winter, with the drenching rains and snow suit Peaches and Nectarines in well-drained soil, the trees being invigorated and the soil nourished. If the houses have fixed roofs, ventilate the house to the fullest extent in all but very severe weather. Proceed with the pruning, bringing matters to a close in respect of cleansing the house and trees as soon as possible.—ST. ALBAN'S.

Weather Notes.

Sussex Weather.

The total rainfall at Abbots Leigh, Haywards Heath, for the past month was 2.03in., being 1.57in. below the average. The heaviest fall was 1.10in. on the 27th. Rain fell on thirteen days. The maximum temperature was 57deg on the 9th, the minimum 27deg on the 20th. Mean maximum, 50.01deg, mean minimum, 37.02deg; mean temperature, 43.51deg—a little above the average.—R. G.

November Weather at Belvoir Castle, 1903.

The prevailing direction of the wind was W.; total ten days. The total rainfall was 1.89in.; this fell on twenty-two days, and is 0.51in. below the average for the month; the greatest daily fall was 0.56in. on the 27th. Barometer (corrected and reduced): highest reading, 30.649in. on the 5th, at 9 a.m.; lowest reading, 29.076in. on the 27th, at 9 p.m. Thermometer: highest in the shade, 55deg on the 12th and 24th; lowest, 23deg on the 19th; mean of daily maxima, 48.30deg; mean of daily minima, 36.20deg; mean temperature of the month, 42.25deg; lowest on the grass, 19deg on the 19th; highest in the sun, 89deg on the 23rd; mean temperature of the earth at 3 feet, 47.10deg. Total sunshine, 89 hours 20 min., which is 27 hours 28 min. above the average for the month; there were six sunless days.—W. H. DIVERS

Notes from Newton Mearns, N.B.

During the past week exceptionally severe weather has been experienced. On Sunday frost set in with much intensity, and overnight 15 degrees were recorded. On Tuesday and Wednesday similar readings of frost were registered, and curling was engaged in in most places. On Thursday there was a slight fall of snow, but at night a very decided thaw set in, and snow gave place to a heavy rainfall. On Friday and Saturday we had a mixture of weather: snow, rain, sleet, and frost, alternately; and in many places the roads are a perfect sheet of ice, making traffic a difficulty. Although at present there is every sign of keen frost again, yet the barometer is low, and unsettled weather may be looked for for some days to come. Outdoor labour is at present at a standstill. So far as the garden is concerned, nothing can be done under such climatic conditions, but the covering of herbaceous plants, Roses, &c., should be attended to without delay.—N. R.

The weather has been dull and misty, with sharp frosty mornings, and a thick fog on the 5th inst.

\*\* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**CATALPA WOOD (H.).**—The wood of the Catalpas is very light, but of a pleasing greyish-white colour, and has a fine texture. It requires to be thoroughly seasoned, and is then reputed to be durable, taking a brilliant polish. No doubt you might have many articles of domestic utility constructed from the tree when the wood is properly seasoned.

**GRAFTING VINES (A Working Gardener).**—The Grape sent is the Black Morocco, which is a good late Grape, requiring stove heat to ripen it perfectly, and special care in setting its berries, a globule of liquid frequently forming on the stigma and impeding fertilisation. This moisture should be removed by gentle agitation, so that the pollen may come in contact with the stigma. You may graft or inarch any of the Vines you name.

**DESTROYING WEEDS ON GRAVEL WALK (G. Foster).**—Dissolve 1lb of powdered arsenic in three gallons of cold water, stirring until it boils, then add seven gallons of cold water and 2lbs of crushed soda. Stir the whole well whilst boiling, and with a rose watering-pot apply to the walks in dry weather from March to May. An inclining board should be placed so as to keep the hot liquid from the grass or Box edgings. The quantity named is sufficient for 25 square yards. Carbolic acid has been recommended to our correspondent for the purpose. We should be obliged by particulars as to the quantity and mode of application.

**BEGONIAS FOR WINTER (O. S.).**—All the species and varieties may be propagated by cuttings, and may be inserted at any time when a brisk bottom and top heat, say of 75deg to 80deg, can be maintained. The precise time for insertion must be determined by the size of plants that you desire. If you wish to have large specimens, and have heated structures for growing the plants, you may insert the cuttings during February and March. If smaller plants are coveted, May and June will be soon enough for propagating, and a cool frame kept close will be suitable for the plants during the summer. An ordinary mixture of loam, leaf soil, decayed manure, and sand, is suitable for growing these plants. The old plants can either be thrown away or repotted after they have flowered. Young plants are usually the most satisfactory.

**PEAR TREES UNHEALTHY (Amos).**—Judging from the spur sent we suspect the cause of the unhealthiness of your trees to be ungenial and possibly water-logged soil. If the soil is wet drain it thoroughly to a depth of 3ft, having a clear outlet for the water. If the subsoil is not wet, then the condition of your trees is attributable to poverty of the soil. The remedy in this case is to remove the surface soil, just bareing the roots, and cover them with the best soil you can obtain, and over the soil place a good covering of rich manure. Limewash the trees, or, what is equivalent, dust them with dry lime when the branches are wet. If blossom buds predominate over wood buds remove some of the former, especially taking off any at the tips of the branches. Your aim must be to induce clean healthy young shoots, not permitting the trees to blossom profusely, and your trees will regain their vigour.

**FORCING LILY OF THE VALLEY (E. D. Lyon).**—If you require Lilies of the Valley early, the crowns are best forced in bottom heat. A bed of leaves about 3ft high is usually required, and in this the pots are placed, covering with about six inches of dry loose leaves. It is much better if a frame and lights be placed upon the leaves, which throw off rains and maintain a more equable temperature; besides, it may be necessary in severe weather to line the sides of the frame and bed should the heat decline, which ought not to be less than 75deg, nor exceed 90deg. When the flowers have grown 4in to 6in above the pots the covering should be removed, and the plants be placed in a light position in a stove, where they expand and attain colour. We have seen them successfully forced by placing a rough frame of boards around the pots, and over that some boards so as to form a cover, leaving 6 to 8 inches of space from the surface of the pots to the boards, covering with leaves or litter about a foot to 15 inches deep, removing the Lilies to a warm house when the flower spikes were 6 inches long.

**PROPAGATING EPACRISES, HEATHS AND CAMELLIAS (W. P.).**—Epacris and Ericas are propagated by cuttings of about 1½ to 2 inches in length. The tips of the shoots when of that length are inserted in pots half filled with drainage, some rough peat placed over it, the pot filled to within half an inch of the rim with fine sandy peat, and the remainder with silver sand pressed firmly; water thoroughly, and a few hours afterwards put in the cuttings, and cover them with a bell-glass, placing in a cold pit or frame, shading from sun. Camellias are increased by grafting upon stock of the single kind. Cuttings for stocks require to be of the ripe wood, inserted firmly in sand, kept in a close frame for a month or six weeks, and then placed in a gentle bottom heat. The plants you name can be bought from the trade growers more cheaply than they can be propagated in private gardens.

**MAKING AN ASPARAGUS BED (A. C.).**—This is best done at the end of March or early in April, being the best time also for planting. If the ground is common loam and well drained, or having a subsoil of gravel or chalk, nothing more is needed than to trench the space intended for the bed, and to mix with the soil as much rich thoroughly decayed dung as can be worked in. Have only two rows of plants in each bed, as this enables them to be cultivated and cut from easily. Set the rows out 2ft apart, stretching the line and drawing with a hoe a drill on each side of it sufficiently deep for the roots to be extended on each side of the little ridge which is thus left between the two drills, and on which ridge the plants are placed. Their roots being equally divided on each side, nothing more is required than filling up the drills with a hoe or rake. The plants should be chosen when they have started into growth 2 or 3 inches; they should be forked out carefully and their roots not allowed to get dry after being taken up. No heads should be cut the first year after planting, and very few the second.

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (F. T.).—1, Cox's Pomona; 2, Bismarek; 3, Allington Pippin.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. L.).—1, Browallia speciosa; 2, Costus ignei; 3, Begonia sanguinea. (J. T.).—1, Cestrum (Habrothamnus) aurantiacum; 2, Grevillea Thelemanniana; 4, Oncidium incurvum. (F. S. Hants).—1, Araucaria Bidwelli.

## Thorn Hedges.

The common White Thorn (*Crataegus Oxyacantha*) thrives so well in this country and makes such an excellent fence when it is properly tended, that it is without doubt the best form of enclosure where low cost and durability are to be combined. It grows well on all good and deep soils, but fails on very thin and stony, or very dry, sandy soils. It has been an old axiom amongst farmers that a good Thorn hedge is a sure sign that the land is worthy of good cultivation, and anyone going over a prospective holding should bear this fact in mind, and beware of the farm the fences of which are declared by the agent to have been neglected, but which may really be a number of danger signals to those who can see them. We do not suggest that farmers are never negligent about their hedges. On the contrary, such is often the case; and for want of timely cutting down, fences adjoining pastures are allowed to become gappy, and ultimately expensive to keep in an effective condition. The excuse is that the shelter could not be spared. That may have been true, but there could be no reason why a portion could not have been taken off, and the remainder at intervals. These big, old hedges are useful as shade when they are on the south or west side of a pasture, but they give but little shelter from the wind when they are on the north or east, for the simple reason that the lower portion has no foliage upon it to break off the cold winds.

It should not be forgotten that a Thorn fence, to be effective, should be widest at the bottom and taper to the top, and this shape is more easily attained when the Thorn plant has been planted in double rows, at least two feet from each other. Three feet of space between the rows may not be at all too much to allow where strong hedges to turn bullocks and horses are

desired. After planting, which should be done during open weather, as early as possible after October, young White Thorn must be well fenced from rabbits and sheep, as well as from cattle, &c. This causes the planting of young fences to be an expensive business, for posts and rails are not picked up in the street; but if the money that the rails would cost be spent in good rabbit wire, 3 feet or 4 feet wide, it may be used as a protection against all comers, and last for many years and for a succession of new hedges.

It is not sufficient to keep live stock at a distance. Couch-grass, Thistles, Nettles, &c., are equally inimical to the growth of young Thorns, and though their hardy nature may enable them to successfully contend with all such enemies, yet the progress made cannot compare with that which follows proper attention to weeding by hand, hoe or fork. After planting no trimming or pruning is required, the only and important attention being that of weeding. This is in case the plants have been put in single rows. But if the double row planting has been practised, we should recommend that the branches on the inner side of each row should be trimmed off after two years' growth. This plan will prevent crowding, facilitate weeding, and encourage outward growth. It will also make possible a mulching with compost between the rows. If this be done every autumn until the fence gets too high, much will be done to lay the foundation for a vigorous and sturdy hedge. A cartload goes a long way, and even such a small protection to the roots is most beneficial.

Having planted a young fence and got it into proper shape and of good height and width, too often we see such a one trimmed or twigged year by year until its roots have lost all their vigour, and the hedge gradually begins to die away. The soil or situation is usually blamed, but the real cause is the continual cutting back of the young wood. The plants being deprived of their proper lung power lose their vigour and die away. No matter how necessary a neat appearance may be, the hedge must occasionally be allowed to go for two or three years. The roots will be immensely benefited, and when the hedge is cut back again to its neat shape, in due course it will grow better than before with its lease of life immeasurably lengthened. There are two ways of killing hedges as well as the use of the stub: one is continuous trimming, and the other is continuous neglect.

Farmers do not sufficiently allow for the great expense which bad fences entail. To keep small, closely-trimmed hedges in a state to turn sheep often costs a great deal in pales and stakes. We have seen such hedges presenting a very neat and tidy appearance, but on examination they would be found largely artificial. As we said before, we do not believe in very high hedges as shelter, but sometimes such are necessary to protect a homestead from high winds. In such cases a certain limit should be put to their height, and they should be kept well sided up every other year: topped one year and sided up the next.

We have often written against the unnecessary plashing or laying of hedges. Farmers are in such a hurry to have a competent looking fence, that they spoil their hedges for the sake of present security. Of course, if a hedge is cut close down, as we recommend, there is the labour of making a strong protective beard of the Thorns, but if the cost of stakes be reckoned, we think plashing proves the more expensive, and a beard may be needed in any case. If a hedge is taken off at the proper time, *i.e.*, when the field adjoining is coming fallows, there will be two years for it to grow on that side before sheep will come against it; so there will be only one side to protect, and if there be a ditch on that side the task is made still easier. Farm labourers are great lovers of plashing, and we do not wonder at it, for it provides a never ending supply of firewood and kindling for them to secure in the future as they return from work.

### Work on the Home Farm.

Two snowy days, followed by 14deg of frost, have sharply reminded us that the period of autumn is past and winter has commenced. Although frost will be most beneficial as an antidote to the floods, we could have well put off the date of its appearance until Christmas. We had planned another piece of Wheat drilling, but now it may be given up altogether. We certainly cannot carry it out unless there is a very rapid change. The frost has been sufficient to stop ordinary land work, but we are able to plough the lea, which has been lately manured for the 1904 Potatoes. We are using chilled ploughs with three horses in each. The furrows turned are twelve inches wide, and vary between 8in and 9in in depth. This is none too deep, but we are going to the full depth of the good soil, there being a bed of fine gravel below. The ploughs do the work well, all being finely

covered, and the land left fairly open, although not so rough as it would be after the steam-plough. The horses are by no means overworked, and each plough is doing 1½ acres per day. We are saving the steam-ploughing at 10s. (which would not be over-much), to allow for a man and three horses, but we also save the coals and the carting of water for the engine. There is, therefore, a balance in favour of the horses. Yet we should prefer the steam tackle if we could always get it when required.

Many Potato pies are being turned over, but few are being sent to market. There are so many foreign Potatoes in our markets that English do not appear to be required at present. £4 per ton, and in some cases a few shillings more, is the price now being taken for well-dressed samples. How many Potatoes remain in the land was shown the other day in a neighbour's field, when a surprising quantity was laid bare by the Wheat drill, and harrows which followed it.

Now is the time to look well to the young horses. They must have something more than frozen grass. If farm work is not sufficient to keep all the working horses employed, and they perforce have a rest, a portion of their corn may with benefit be diverted to the young ones out at grass.

Young sheep, being now well inured to a Turnip diet, may have their cake and lamb food reduced, but if the weather continues cold they must have some dry food. Hay and clover are cheap and plentiful, but we should prefer cut straw and a little barley meal mixed with it, especially if we possessed some Barley of the unsaleable type.

**PRIZES FOR AGRICULTURAL ESSAYS.**—The Chemical Manure Manufacturers' Association is offering four prizes of £10, £5, £3, and £2 respectively for short essays on "The Utility of Superphosphate, used either alone or in conjunction with other manures as a top-dressing for pastures and grass lands, and with special reference to its influence on the milk-producing and stock-carrying capacity of the land to which it is applied." Further particulars will be supplied to intending competitors on application to the Secretary, the Chemical Manure Manufacturers' Association, 79, Mark Lane, London, E.C.

**ROYAL SCOTTISH AGRICULTURAL BENEVOLENT INSTITUTION.**—This Institution, which was founded in 1897 in commemoration of the Diamond Jubilee of the late Queen Victoria, and of which His Majesty the King is patron, and the Duke of Buccleuch honorary president, has been making progress and doing good work. From its last report it appears that the funds, although they have increased year by year, are not adequate to meet the numerous pressing claims upon them, so many as twenty eligible applicants having to be refused on this account. The main object of the Institution is to provide pensions of £20 per annum to aged or infirm and necessitous persons (male and female) connected with agriculture in Scotland, who, through no fault of their own, have been reduced to a condition of poverty. The directors appeal to all interested in agriculture and others for contributions to the funds, to enable them to deal with these and other new cases which are constantly arising. We are informed that the pensioners hail from practically every county in Scotland, and that some of them are upwards of ninety years of age. Full particulars regarding the Institution and its pensions can be had on application to the secretary, Mr. Isaac Connell, S.S.C., 10, North St. David Street, Edinburgh.

**WEBB AND SONS' STAND AT THE LONDON CATTLE SHOW.**—The exhibit of roots, &c., made by Messrs. Webb and Sons, the King's Seedsmen, Wordsley, Stourbridge, can only be described as wonderful. It comprises specimens drawn from the successful crops in this firm's Annual Root Crop Competition, which showed returns of upwards of 78 tons of Mangolds per acre, and 61 tons of Swedes grown by the application of Webbs' Special Fertilisers. The produce of Webbs' Pedigree Seeds has also been eminently successful at all the important shows. Perhaps the most remarkable roots are those of Webbs' Imperial Swede, which are massive in size and of beautiful shape and quality. It has secured the Champion Prize this year at both London (61 entries) and Birmingham (30 entries), besides a vast number of other important awards. Webbs' Invincible Turnip and Webbs' Selected Green Globe Turnips, both of which won first prizes in their class at Birmingham last week, combine large size, with perfect shape, a remark which equally applies to Webbs' New Arctic Swede and Webbs' New Buffalo Swede. Messrs. Webb also exhibit the new and improved cereals which they have raised by cross-fertilisation and selection, their systematic experiments having been most successful. The Kinver Chevalier Barley, for instance, is recognised as one of the best varieties in cultivation, and in addition to its success at the Brewers' Exhibition, already noticed, it has recently won the Colchester Gold Cup, first prize, Norwich; first prize Edinburgh, &c. Webbs' Newmarket Oat also maintains its reputation as the most profitable variety to grow. A very fine collection of Potatoes is exhibited, and among them we were particularly struck with a kidney-shaped variety, recently introduced and named Webbs' Guardian, which it is confidently predicted has a great future before it.

# Bunyard's Fruit Trees

## THE NEW DESCRIPTIVE CATALOGUE

Is now ready, and will be sent free for 6 stamps.

The Stock is superb this year, and embraces all the best kinds in every fruit, for Outside or Glass Culture.

ROSES are included in the above.

The Trees are very fine.

## THE GENERAL NURSERY CATALOGUE

of CONIFERS, SHRUBS, and TREES, in 2,000 varieties—free.

## GEORGE BUNYARD & CO.,

LIMITED,

Royal Nurseries, Maidstone.

## GRAPE VINES in POTS

Extra Strong Fruiting and Planting Canes in all Leading Varieties.

## FIGS IN POTS

All Leading Sorts.

Catalogue Free on Application.

## PLANTING SEASON.

We invite the attention of Planters to our large and Superior Stock of FOREST TREES, FRUIT TREES, ROSES, RHODODENDRONS, HOLLIES, and Shrubs of all kinds.

## OUR CRAIGMILLAR NURSERIES

are the most exposed in Britain, and produce Plants which cannot be surpassed for Hardiness and Health.

New Catalogue Now Ready, and will be Posted Free on application.

The King's Nurserymen,

1, WATERLOO PLACE, EDINBURGH.

No. 1225.—VOL. XLVII, THIRD SERIES.

# CLIBRANS HARDY CLIMBERS

ESTABLISHED IN POTS.

THE following is a selection from our List of Hardy Climbers. Charming effects can be produced by using them to cover walls, pergolas, arbours, arches, summer houses, &c. All are strong, healthy, established plants.

- Actinidia arguta*, a strong, quick-growing species, 1/- and 1/6 ea  
 „ *kolomikta*, a rare species producing white flowers, 1/- and 1/6 ea  
 „ *polygama*, flowers waxy white, foliage brightly tinted in autumn 1/6 ea  
*Akebia quinata* produces fragrant flowers 1/6 to 2/6 ea  
*Ampelopsis hederacea*, the well known Virginian Creeper, 1/- and 1/6 ea.; 9/- and 12/- per doz.  
 „ *Veitchii*, a popular species, it clings most persistently to walls, woodwork, &c., 1/- and 1/6 ea.; 9/- and 12/- per doz.; extra size, 2/6 and 3/6 ea  
 „ *Veitchii purpurea*, the leaves differ from the type in the fact of their being of a greenish purple, 1/6 and 2/6 ea  
 „ „ *atropurpurea*, much deeper in colour than the former 1/6 and 2/6 ea  
*Aristolochia sipho*, dark handsome foliage, vigorous grower 1/6, 2/6, and 3/6 ea  
*Bignonia capreolata* produces reddish yellow flowers, 1/- and 1/6 ea  
 „ *grandiflora*, rich orange scarlet flowers 2/6 ea  
 „ *radicans*, orange scarlet flowers, strong growers, 1/6 to 3/6 ea  
*Bridgesia spicata*, a vigorous growing evergreen creeper, clings tenaciously to wood or walls 1/- to 2/6 ea  
*Humulus lupulus foliis aureis*, a pretty golden leaved variety of the common Hop, vigorous grower, 1/- and 1/6 each; 9/- and 12/- doz.  
*Jasminum nudiflorum*, a well known winter bloomer, producing yellow flowers 1/- and 1/6 ea  
 „ *nudiflorum fol. aureis*, a golden variegated form of the preceding 1/- and 1/6 ea  
 „ *primulinum*, a newly introduced species from China, the flowers are similar in colour to those of *nudiflorum*, but are much larger. It is also an evergreen. F.C.C., R.H.S. 5/- and 7/6 ea  
*Lonicera aurea reticulata*, emerald green leaves, prettily netted with gold 1/- and 1/6 ea  
 „ in variety, choice sorts 1/- to 2/6 ea  
*Menispermum canadense*, large, heart-shaped foliage, 1/- and 1/6 ea  
*Polygonum Baldschuanicum*, a gloriously beautiful climber, producing glossy green leaves and elegant clusters of pale pink flowers 2/6 and 3/6 ea  
*Smilax aspera* } two bright glossy, green-leaved plants,  
*australis* } with prickly stems 1/6 and 2/6 ea  
 „ *Vitis coignetiae*, an attractive species, producing large handsome foliage 2/6 and 3/6 ea  
 „ in various choice sorts 1/6 to 2/6 ea  
*Wistaria japonica*, a white flowered species, strong grower 2/6 to 3/6 ea  
 „ fl. pl., a double flowered form 2/6 and 3/6 ea  
 „ *multijuga*, lilac flowers, produced in exceedingly long racemes 2/6 and 3/6 ea  
 „ *alba*, similar to preceding, but produces white flowers 2/6 and 3/6 ea  
 „ *sinensis*, lovely lilac flowers, excellent climbers, 2/6 to 3/6 ea  
 „ *alba*, white flowered form 2/6 to 3/6 ea  
 „ fl. pl., double flowers 2/6 to 3/6 ea  
*Clematis*, choice and beautiful varieties, our selection, 10/6 to 15/- per doz  
*Ivies*, our collections include all the best varieties—  
 Collection A, 6 in 6 pretty, distinct sorts 4/6 and 7/6  
 „ B, 12 in 12 pretty, distinct sorts 9/-, 12/6 and 15/-  
 „ C, 24 in 24 pretty, distinct sorts 18/- and 31/6  
 „ D, 12 beautiful sorts, consisting of 5 bronze, 5 silver, and 2 golden varieties 12/- and 18/-  
 „ E, 5 beautiful bronze varieties 4/- and 7/6  
 „ F, 5 charming silver varieties 5/- and 7/6  
 „ G, 5 pretty, small, green-leaved varieties 3/6 and 7/6

## Journal of Horticulture.

THURSDAY, DECEMBER 17, 1903.

## Lessons of the Year.

THE great storm in February of this passing year will not hurriedly pass from the minds of the present generation. There is, indeed, sufficient evidence in the many thousands of "tall ancestral trees" still lying where they fell on that memorable night, to make any immediate reminder of its fury necessary. Yet, surely, some lesson, some good, can be extracted from the evil which blots the landscape, and, possibly, lessons, too, from the sunless and saturated conditions which have prevailed.

First, however, to our trees. At a rough calculation from local data, ninety per cent. of the total wreckage is represented by Elms, the remainder chiefly consisting of Horse Chestnuts, Sycamores, Limes, and Poplars. In a long belt of Beeches fully exposed to the violence of the gale, no casualties occurred, and the same immunity was observable amongst specimen Oaks, Turkish and common, which escaped with merely some wrenching among their branches. Hoary specimens of the Evergreen Oak, then in luxuriant leafage, and which bore the full brunt of the blast, only suffered to the same extent.

Whilst occupied in the first consideration after the storm—viz., clearing blocked roads and avenues—a visitor propounded the rather pertinent question "If Elms suffer so much, and other trees escape, why are Elms so much planted?" No use in pointing to a veritable monarch of the tribe which, for a century at least, had braved all the winds that blow ere that eventful night laid it low—that did not answer the question; so again may it be asked in view of such lamentable results and the ever present possibility of the recurrence, Why are Elms so much planted? It is partly answered, but only partly, in remarking that the Elm is a popular

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

tree, in fact the most commonly grown timber tree of Europe, and this owing, probably, to its easy cultivation, rapid growth, and adaptability to various soils and situations, as well as possessing the power to thrive in smoky localities.

That the Elm is capable of attaining sufficiently magnificent proportions as to render it historical is evidenced by the report of one being cut down by Sir Hans Sloane at Chelsea, about the year 1720, which, measuring 13ft. in circumference and 110ft. in height, was said to have been planted during the reign of Queen Elizabeth. Doubtless, too, many fine specimens still exist over the area of the British isles, but the fact remains that superb avenues of the common Elm, *Ulmus campestris*, which a few years since proudly ornamented many a grand old demesne, are now merely the wrecks and relics of departed glory. It is not only the time-honoured, and those full of years which have succumbed, for the storm swept away Elms of all ages and in all stages of growth, either by ruthlessly uprooting them or splintering off their stems midway like matchwood. Much, I am aware, could be done to save fine trees in lightening heavy tops by severe pruning, but, alas! it seldom is done, and in sequence the question again crops up, "If Elms suffer so much, and other trees escape, why are they so much planted?"

Truly, "knowledge comes if wisdom lingers." Necessarily in a well-timbered demesne, variety is expected, although this consideration did not always obtain with planters of yore. For instance, in this particular locality is a fine old estate known as Elm Park, and rightly named, for until the storm of February last its primary feature was the magnificent Elms with which it was literally studded; but very few, however, then escaped, and it is now strewn with the prostrate giants. "How are the mighty fallen!" As the trees consisted solely of Elms, this venerable place might now be aptly re-named Bare Park, especially as there is nothing coming on to replace the ancient Elms. There is plenty of evidence in enormous discs of soil and roots now standing vertical, as the giants toppled over and upheaved them, to show that the Elm is a shallow rooter, but, and as previously remarked, where the roots stood the strain something had to go, so the trunk in that case was simply splintered off.

The merits of *Quercus cerris*, the Turkey Oak, may well claim more consideration from planters than it appears to do; its straight, graceful habit of growth making it a most desirable tree for demesne planting, whilst its storm-resisting qualities, with the commercial importance of its beautifully grained timber, are points not to be overlooked. In planting, present effect more than future utility is too often regarded. One generation plants with vague ideas of prospective timber, the next reaps a sure and certain crop of firewood. Possibly but few, at planting time, look far enough into the future to weigh its sequential probabilities.

A wet season is credited with being detrimental to Potato culture, and rightly so. Is it not also inimical to the Potato blight?—viz., does *Phytophthora infestans* flourish in wet, retentive soil? This question is asked in all seriousness, for in spite of the well-known rapid development of the scourge under warm, humid conditions, on several occasions this season it has been a matter of surprise to see perfectly sound tubers lifted from cold, saturated soil. In one instance this occurred recently (last week in November); hence, from the somewhat meagre data available, the conclusion is arrived at, rightly or wrongly, that in an excessively cold, wet soil, *Phytophthora infestans*, if it exists, is unable to flourish to any harmful extent.

Effects of the year's abnormal rainfall must be more or less pronounced upon the land. Ill-drained pastures are already showing this to an appreciable extent in mossy growth, and the necessity of clearing out and keeping clear, watercourses, ditches, or what not, for the quick removal of the superfluity, cannot fail to have impressed its importance. To more or less extent the excessive irrigation must be detrimental to soil fertility in carrying away soluble nitrates. Defective drainage resulting in waterlogged soil cannot, either, but militate seriously against healthy vegetation in the near future. In gardens and pleasure grounds this season has plainly shown any weak spots in the surface drainage, and, as opportunity occurred, measures have been taken to rectify defects.

Deep stokeholes often give serious trouble if not properly drained, and draining them is sometimes a difficult matter. Experience of one bad example in which, on exceptional occasions, all-night pumping had to be resorted to, led to urgent steps being taken, a few years since, to remedy the nuisance. It proved a difficult and laborious task, a trench 8ft. deep, and 150yd. in length, having to be cut through a shrubbery abounding in tree roots ere sufficient fall could be obtained. Glazed drain pipes, of 4in. diameter, with cement joints and inspection chambers at intervals, completed the job for all

time, and one cannot but think, in a season such as this has been, how good and excellent a thing it is to have one's drains in order. Troubles in other directions show how futile was the practice our forefathers resorted to in making stone "shores" to carry off a rapid rush of surface water, owing to the percolation of tree roots through the interstices, and the eventual choking of the drains. Such loosely-made drains are, obviously, advantageous for a time by affording lateral drainage of the subsoil in their immediate vicinity, which the glazed pipe does not, but their final choking is a serious matter, and of two evils, choose the least.—A. N. OLDHEAD.

## Practice, with Science.

"One million sterling annually, to the true practical and sympathetic education of the farmer (and gardener), or, rather, the farmer's son, during all those years of two full generations that the inertia of ignorance was thrown into one scale (i.e., the inorganic) would have paid the British nation magnificently. Such education should have begun in the very year of the repeal of the Corn Laws. Yet a challenge was recklessly thrown to the world to do its worst, and was accepted. The effects have become relentlessly manifest."—H. H. RASCHEN, "Journal of Horticulture," page 529, Dec. 10.

National changes are now in progress, and if the agriculturists and horticulturists of this country will sufficiently bestir themselves, some of the evil effects of past negligence and apathy may be remedied, and the science of horticulture (which is agriculture in a more intense form) will inevitably become an indispensable national factor and asset, potential with results that are all for good.

Our pages have recently recorded what assistance each of the county councils throughout the United Kingdom is furnishing toward horticultural instruction, and in this place we would briefly outline the more permanent horticultural provisions that are now in vogue at various centres. One of the chief of these is at Holmes Chapel, Cheshire, where State aid is given; another is at Chelmsford, Essex; a third at the Uckfield Agricultural and Horticultural College, Sussex, and one at Reading. These are the localities where horticulture receives permanent, and fairly adequate, attention. No other counties in England, not even Yorkshire or Devonshire, seem to have large permanent school-gardens in operation with properly equipped laboratories and class-rooms.

Attention was called in our pages some weeks back to a proposal that the South-Eastern Agricultural College at Wye, Kent, should endeavour to establish a horticultural branch, with class-rooms at, or very near to, Wisley, where the new garden of the Royal Horticultural Society is situated. If this becomes accomplished, as it doubtless will, this southern centre may very probably occupy the premier position in the teaching of the principles and science of horticulture within the United Kingdom, and it has also been suggested by the Scientific Committee of the Royal Horticultural Society that a qualified director be appointed by the Society for its new garden, to conduct experiments appertaining to horticultural botany, as well as other researches, so that the joint influence and operation in connection with such a society would certainly endow this "London" centre with ruling and leading powers.

A School of Forestry is another proposal made from Wye, and this also would be established at Wisley. Such a school has been long proposed for Scotland, the headquarters for the teaching of forestry being at Edinburgh, where Colonel Bailey delivers regular courses under the direction of the Edinburgh and East of Scotland College of Agriculture.

The present discussion in the *Journal of Horticulture* and other gardening papers, on the need for a gardeners' association or guild, makes it opportune to review the educational work having a direct horticultural bearing. The purely practical gardener—the rule-of-thumb man—looks askance at schools and colleges, and at theoretical instruction, and makes many uncomplimentary references to inane, in students undergoing the curriculums. But those who have closely read the letters that discuss the present proposition (the gardeners' association) will have noticed that agreement is general on one point, namely, that the social status of gardeners should be raised. That is the point grasped by all; and the means to the end is this: Provide better-educated probationers. The colleges, therefore, will undoubtedly do good, for they turn out young men of mettle, who have had a training fairly broad in its scientific and practical aspects, and they are supposed to be imbued with both the desire and power to add to their knowledge; and thus they are superior to the average under-gardener, whose daily toil is often laborious, and whose training or instruction, according to the strict application of the meaning of both these words, are left to his own initiative. Of course, just as "science is starved," so may the scientifically-trained gardeners be, but, at all events, the educated man commands respect.

Turn we now to describe some of the features of the existing colleges, and from the reports and prospectuses of the institutions mentioned in the opening lines, we have selected the following

particulars, which are typical of the courses of instruction at these places.

At the Agricultural and Horticultural Training School and Farm, Saltersford Hall, Holmes Chapel, Crewe, the staff includes:

(1) Principal, who is lecturer on agriculture and agricultural chemistry, and manager of farm, and conductor of experiments.

(2) A lecturer on land surveying and levelling, farm mechanics, book-keeping, and assistant to the principal in agriculture.

(3) A lecturer on chemistry and analyst. (4) A lecturer on natural sciences, mathematics. (5) A lecturer on veterinary science.

(6) A lecturer and instructor in horticulture, and head gardener. (7) A teacher of drawing. (8) An instructor in practical woodwork and carpentry. (9) A drill sergeant. (10) Matron of the school.

"The course of work and study laid down for the students may be described as theoretical work in the shape of lectures, &c., during the mornings and practical work during the afternoons. Practical work includes not only taking part in the various operations on the farm and in the garden, or on the experimental plots, or management of the cattle, &c., as they occur throughout the year; but the land surveying, practical chemistry, woodwork, &c., forming part of the curriculum. The practical work in the garden is under Mr. Neild, while that in the laboratory receives the attention of Mr. Thompson, and the biological work that of Mr. Eastham. The practical work is obligatory on all."

"An important side of the work at the School is the attention given to gardening in all its branches, and excellent provision is made for such in the gardens, which cover seven acres, and are fitted up with orchards of young fruit trees, and a considerable range of glass houses for the culture of Grapes, Melons, Tomatoes, Cucumbers, flowers. Considerable attention is also given to the cultivation of bulbs, while the propagation of fruit trees, and of grafting, is made a special feature. The cost of providing this agricultural and horticultural School was necessarily great; the amount so expended at Holmes Chapel being £13,437."

ESSEX.—"The aim of the County School of Horticulture is to impart sound elementary instruction in the best methods of cultural treatment, based upon a knowledge of the structure and physiology of plants. The School is organised to give courses of systematic laboratory and garden instruction to two kinds of pupils. (1) To pupils who are unable to attend the School for more than three or four weeks at a time; and (2) To pupils desirous of obtaining a full year's course of continuous instruction. The classes meet daily for lectures, demonstrations, and practice."

"(1) Short-term courses.—A complete junior course of instruction is given in the four terms corresponding with the four seasons of the year. Three of these terms last for three weeks each, and one of a more advanced character lasts for four weeks. In the intervals between the short-term courses, students are supposed to be engaged in gardening and putting into practice the principles and methods taught at the School."

"(2) Ordinary School course.—The ordinary School course includes at least one year's continuous instruction, and is divided into three terms: (1) Autumn term (September—December). (2) Winter term (January—April). (3) Summer term (May—July)."

The fees are: (1) Short-term courses: Essex county students, free; outside students, £1 per week. (2) Ordinary school course: Essex county students, £15 a year; outside students, £20 a year.

The laboratories accommodate 44 students. They are well lighted, heated and ventilated, being provided with lockers, kits, microscopes, tables, and there is a good library of books useful to horticultural students. A small greenhouse is attached to the laboratory for the convenience of students in their observational and experimental work. Visits are made from time to time to nurseries, fruit farms, and market and private gardens, for purposes of demonstration and study, in the summer field excursions are organised for the study of open-air botany.

The garden covers an area of three acres, and is entirely devoted to educational uses. It is divided into five main sections. (1) A botanical garden, in which the plants are systematically arranged in Orders, according to the natural system of classification. (2) A vegetable garden well stocked with all useful English-grown vegetables in season. (3) A fruit plot A, for growing varieties of fruit, and demonstrating different forms of trees. (4) A fruit plot B, to be used as an orchard. (5) An experimental plot for trials of new plants and competing varieties. In addition to these five main sections there are: (6) The borders, forming a very distinct feature of the garden. The south border is furnished with a representative collection of shrubs, and the east and north borders with Conifers and forest trees. (7) The Rose garden, consisting of seven beds, each representing a different class of Rose. (8) Plant houses, consisting of a range of greenhouses, including a propagating pit, a vinery, warm and cool plant-houses, and frames. A working bench is provided for each student, which he is expected to keep tidy, and a numbered set of tools which he is required to keep clean. Bins are provided for the different kinds of soils, &c., and a right place for everything, and students are requested to avoid disorder. Each student provides himself with an apron, and with pruning and budding knives.

At Uckfield, Sussex, there are good lecture-rooms, splendid

analytical and bacteriological laboratories; a botanical room with appurtenances, carpenter's shop, and the residential portion of the college contains every convenience for a healthy and enjoyable life. The gardens extend to nearly five acres, and is sectioned on the lines indicated in the Chelmsford notice, above. Fruit-bottling, and the drying and preserving of various fruits and vegetables, we are glad to see forms a feature in the curriculum.

From the foregoing, it will be seen that Great Britain—England, we ought rather to say—has of recent years come to recognise that agriculture and horticulture demand more than mere empirical application, in order to successfully meet foreign competition and practice, and though the advance made is utterly inadequate to the needs of the times, yet will we hope on, and strive each to do something toward the transfusion of that spirit for efficiency, for which Lord Rosebery pleaded two years ago.

## Carnations and Begonias.

### Winter-blooming Carnations.

Messrs. George Boyes and Co., of Aylestone Park Nurseries, Leicester, show banks of Carnations at a number of the Chrysanthemum shows in November, in various parts of the country. When Mr. Boyes, the head of the firm, was at the Crystal Palace Show some three weeks ago I got him to mark a few of the best out of the many that he grows, and they are as follows: Stanley Weyman, a free flowering, large scarlet, the best in this colour; Dr. W. G. Grace, another bright scarlet, the largest scarlet yet sent out, a larger bloom than Lawson. It is beautifully scented, and a strong, vigorous grower, giving abundance of bloom on long stiff stems; "As far in advance of all other scarlets as Grace was in advance of all other ericketers," says Mr. Boyes. When once before the public it will cause a greater sensation than Lawson, which is surely saying a good deal. Then there is A. J. Webbe, still among scarlets, the edges being serrated or fringed in the true American style, and it is sweetly scented. Also Hon. A. Lyttleton, an exquisite salmon coloured variety, very free flowering. Lady de Trafford was one of a set sent out in 1902, and is spoken of as the best of that lot. In colour it is clear red, magnificent in size, and is "sure to take." Lastly we have Lady Carlisle, magnificent pink, one of the largest, clearest, and most solid pinks yet seen, and sweetly scented. One bloom is quite sufficient for an ordinary buttonhole; it wears well and keeps its shape after cutting. Lord Kitchener is a very large and splendid crimson. All of those here named are trees for winter blooming, but they vary considerably in price. What beats the Carnation?

### Ware's Tuberous-rooted Begonias.

The display of these choice and increasingly popular greenhouse and bedding plants at the Bexley Heath Nurseries of Messrs. T. S. Ware (1902), Ltd., is worth half a day's journey to see. The most gorgeous colour scenes on the stages of theatres hardly eclipse the brilliance and richness of the beds side by side and stretching away for a quarter of a mile under the orchard trees in the nursery first named. The varieties are assorted into unitary colours, and it would not be a bad idea at all if here and there a private garden could utilise some of the spare space that is generally to be found by planting it up with breadths of these radiantly rich dwarf flowering plants. Messrs. Ware cultivate about 100,000 of the tubers in this open-air fashion, there being nearly twenty long and broad beds, and the range of colours embraces crimson, scarlet, pink, salmon, bronze, white, yellow, magenta, blush, and orange, though that does not even complete the entire list. Many of the plants are grown for the supply of seed, but the majority, of course, are for the tubers, which everybody can manage without much fear of failure, and the sorts can then be guaranteed true to name. Of new varieties I would name Mary Pope, a grand, Camellia-shape, double white; Queen Alexandra, a beautiful Picotee type; Mrs. W. G. Valentine, a large double crimson; Miss Barbara Ray, a double of a dark, intense orange hue. There are also Countess of Cadogan, a golden-orange; Lord Rosebery, rich deep crimson; and Mrs. Andrew Tweedie, Camellia-shaped and cream coloured; a gem. With these, there was a magnificent collection of double and single flowered seedlings in flower little over a month ago, notwithstanding the rain, the winds, and the cold weather. What beats a double Begonia?—J. H. D.

A PIT-MASON DUCHESS.—I, for one, thought the "Pit-Mason Duchess" (and I am English!) quite funny enough to smile at—a very harmless thing to smile at, too. It reminded me of a little incident that occurred to myself a few years back. An old man (a rare old vegetable grower) invited me to see a fine bed of Cabbages. I naturally asked him the variety. He replied: "Dan's Sianee"! I puzzled over his answer for an instant, when it struck me that Daniels' Defiance was intended. Daniels' Defiance is a grand Cabbage with cottagers, and Pitmaston Duchess is a grand Pear in some soils. —P.S. I fancy "Pit-Mason Duchess" and "Dan's Sianee" would be something for Dean Hole to smile at.—A. B.

**Lælio-cattleya × Decia.**

Many charming hybrids have emanated from the nurseries of Messrs. J. Veitch & Sons, Chelsea, and among these may be included the beautiful Lælio-cattleya × Decia, a bloom of which is depicted in the illustration. This is the result of a cross between Cattleya Dowiana aurea and Lælia Perrini, the first named being the pollen parent. In many respects the flower resembles a Lælia more than a Cattleya, except in size. The sepals and petals are very pale rose, the lip at the base being rosy mauve, with a deep purplish crimson lobe. This fine hybrid is being frequently exhibited by Messrs. J. Veitch and Sons at the Drill Hall, Westminster. A First-class Certificate was awarded for it by the Orchid Committee of the Royal Horticultural Society.

**Cœlogyne (Pleione) Lagenaria.**

Perhaps a few remarks on the treatment afforded this pretty little Intermediate House Orchid may not be out of place at this season. Let the pseudo-bulbs be repotted so soon as new leaves begin to appear (if this operation has not already been carried out), which is from the same point as the flower previously occupied, as by that time new roots are beginning to push somewhat freely. A compost I have used with very good results consists of peat, two parts; sphagnum, one part; half-decayed leaves, rough and flaky, one part; and a little silver sand, charcoal and dried cow manure. Shorten the old roots, leaving enough to hold the "bulbs" in place, and pot them level with the rim of the pot, burying the "bulbs" up to the neck, as the new ones will be much higher when they develop. I find the cooler end of the Cattleya House suits them very well so far as temperature is concerned, and water may very sparingly be given until growth is active. When the roots have permeated the soil thoroughly I find an application of weak, liquid cow manure, at each alternate watering, very beneficial, never allowing the compost to get really dry before affording water when the plants are in full growth. —GROWER, North Wales.

**The Troubles of an Orchidist.**

The woes dealt out to mortals are many from the first,  
But the troubles of an orchid man must surely be the worst!  
For when the fever smites him with its stony, mailed fist,  
There's no escape left open—he's a full-fledged orchidist!

He'll ponder over price lists; he'll burn the midnight oil,  
And he'll send all o'er creation for sample peat or soil;  
He'll argue till he's tired on the merits of his way,  
How and when to sun or shade 'em, 'till there's nothing left to say.

He has some fine Angraecums, an Oncidium or two,  
Fifty-seven kinds of Dendrobies and a Vanda, real true blue;  
He has lots of Catasetums and a Stenoglottis pink,  
No end of Epidendrums and Calanthes, too, I think.

His *Miltonia speciosa* is the finest in the State,  
And his *Cypripedium* hybrids are—well, they're simply great;  
He imports *Odontoglossums*, *Cattleyas* by the score,  
Has forty *Lælia* crosses and *Cymbidiums* galore.

The costly *Phalaenopsis* and the *Isochilus* queer,  
The lovely *Sophranitis* and the *Spathoglottis* dear;  
There's a *Brassavola glauca*, and an *Ionopsis* too,  
Such a charming *Microstylis* and an *Aërides* that's new.

There's a pot of *Bulbophyllum* that's enough to drive one frantic,  
*Masdevallia cucullata* and *Stanhopea* gigantic;  
There's *Sobralia Amesiana* and *Phaius* rich and rare,  
And a *Chysis Langleyensis*—but I really must forbear.

For were I to go further and enumerate the lot,  
Tetanus would seize me—I'd expire on the spot.  
These, and many, many others are the symptoms of his plight,  
And he's happiest among them, be it morn or noon or night.

Oh the woes dealt out to mortals are many from the first,  
But the troubles of the orchidist must surely be the worst!

—("American Gardening.")

**Decorations with Orchids.**

At the visit of the Italian monarchs Orchids only were used to decorate the Royal table at the Guildhall luncheon. Between three and four thousand of the dainty and costly blooms were arranged in gold stands specially designed for the occasion, representing the Italian colours of green, white, and red. The other twenty-six tables were embellished with Carnations, white Lilacs, Roses, Lilies, and Chrysanthemums—in all about 9,000 blooms—or a grand total of between 12,000 and 13,000 Orchids and less important flowers. To a generous

corporation the cost is of secondary importance. When the King and Queen lunched in the Guildhall last year the sum of £270 15s. was spent on flowers.

**Cultural Notes: Lælias and Cattleyas.**

*Lælia albida*, now pushing its flower spikes, has puzzled cultivators more, perhaps, than any other of the Mexican species belonging to this favourite genus. It does not possess the strength of its compeers *L. autumnalis* and *L. anceps*, and, while moving along vigorously for a few years after importing, soon feels the strain of having an unnatural atmosphere about it. I have tried *L. albida* in all sorts of receptacles and in various temperatures, and my experience points to a medium or Cattleya house temperature in winter and an airy, moderately dry house in summer, as likely to lead to the best results.

A trellised block is suitable as a rooting medium, covering this thinly with equal parts of sphagnum moss and peat or leaf soil. Singularly enough, the strain of flowering does not appear to have any ill effect, or but little, upon the health of this charming plant, but something indefinable and quite mysterious in our artificial treatment is not to its taste. My advice is to flower it as freely as may be, always provided that the plant is strong and well rooted. To flower it at all before properly established is wrong. The soft white scale that affects it must be fought by sponging frequently, or good health is out of the question.

*L. majalis* is quite at rest now, and should be suspended in a light, cool place until signs of growth appear. Then place it rather suddenly in warmer quarters, but without much atmospheric moisture, when every young lead will be found to contain a spike of its very showy and yet refined flowers. Plants that are kept moving in winter never flower at all freely, and this is equally true of other and larger-growing Lælias. The popular *L. purpurata* is never so free as when the growth finishes up in autumn, rests in winter, and comes right away to the flowering stage in spring.

*Cattleya citrina* is becoming active, and must be given a cool, moist, and light position. The natural position of the growth, apparently upside down, is a protection to the forming spike in the young lead, preventing moisture from collecting therein. Still, a lot of syringing is not advisable, especially during dull, wet weather. Like the species named above, *C. citrina* does not relish a lot of compost about its roots. It should never be forced to grow when it seems inclined to rest, or vice versa, but the plants watched individually, and retarded or encouraged as seems necessary. Puncture or abrasion of the leaves during cleaning operations must be studiously avoided. —H. R. R.

**The Liliaceæ.\***

(Continued from page 493.)

The three genera of Chlorogaleæ are *Bowiea*, *Chlorogalum*, and *Nolina*. *Bowiea* is a curious monotypic genus, closely allied to *Scilla* by its flower and bulb, yet mimicking the growth of *Asparagus*. *Bowiea volubilis* was sent to Kew 1862. It was planted in the Succulent House, and when it produced its long, slender stems it became an interesting object to botanists. It produced flowers the second year. The genus was named after Bowie, formerly a collector for Kew, at the Cape of Good Hope. The bulbs of *Chlorogalum pomeridianum* are used as a substitute for soap in California. A visible benefit might be the result of its cultivation in the Transvaal.

The next section to be considered contains the caulescent genera, i.e., those with leafy stems and capsular fruit. They have never an introrse dehiscence of the anthers, in this respect differing from the typical Liliaceæ. This group contains the showiest plants of the Order, including a large amount of garden forms which in their wild state are chiefly restricted to the N. Temperate regions. The tribe Tulipeæ, which we will now consider, comprises 200 species in six genera. The three most important are *Lilium*, *Fritillaria*, and *Tulipa*.

**Lilium.**

Amongst all hardy bulbous plants the species and varieties of this genus stand first; their graceful habit and rich colouring making them invaluable for decoration either as cut flowers or border plants. They are derived from all parts of the Northern hemisphere, and are mostly found growing in fairly good soil, and in association with shrubs or other plants which shade their roots, keeping them cool, and at the same time preventing excessive evaporation of moisture.

The majority thrive best in soil rich in humus, though some give excellent results in ordinary garden soil, and others again will hardly exist except in peat. When planting, however, it is advisable to place a layer of fibrous peat below the bulbs, and to envelope the bulbs with sharp sand. The depth they should be planted at depends upon situation and variety. In a protected situation the bulbs of such forms as *L. parvum*, *Greyi*, and

\* A paper read before the Kew Gardeners' Guild by Donald MacGregor. The sequence is based on Mr. J. G. Baker's classification.

nitidum need not be deeper than 3in, whilst giganteum, pardalinum, monadelphum, may be put to a depth of 8in.

Where there is a choice of situations they ought to be accorded a position which is shaded from the direct rays of the mid-day sun. Associated with Rhododendrons, Bamboos, and other elegant plants which do not rob the soil of moisture, they produce a superb effect, enhancing the beauty of the shrubs in return for the protection received. One of the most pleasing combinations is *L. tigrinum splendens* in a bed of *Cornus alba* var. *Späthii*.

According to their requirements they may be classed under four headings. Firstly, those that thrive in a moderately light soil, as *L. candidum*, *testaceum*, *chalcidonicum*, *longiflorum*, *elegans*, and *dauricum*. Secondly, those that require a deep.

#### EULIRION.

The Burmese species are the handsomest in this section. A white flowering form is *L. Wallichianum*. Closely resembling it, but differing by its dwarfer growth and the possession of a greenish tint on the exterior of the perianth, is *L. Neilgherrense*. *L. sulphureum*, a handsome yellow-flowered species, may be best described as a yellow flowered *Wallichianum*, from which it differs by its slender anthers and its copious production of bulbils in the axils of the leaves. *L. ochroleucum*, and *Wallichianum* var. *superbum*, if not identical with *sulphureum*, differ but slightly.

Three other Burmese species possessing a shorter, more cup-shaped perianth are Nepalese, attaining a height of from 6ft to 7ft. It has the interior base of the perianth blotched with

Lælio-cattleya Decia.

stiff soil, as *L. tigrinum*. *Humboldti*, and most of the *Martagons*. Thirdly, those that require a peaty soil are *L. Browni*, *Grevi*, *monadelphum*, *rubellum*, and *pardalinum*. Fourthly, tender forms requiring the protection of glass houses. According to Mr. Baker's Monograph, the genus is divided into six subgenera.

**Cardiocrinum.**—Leaves stalked, flowers funnel-shaped.

**Eulirion.**—Leaves sessile, flowers trumpet or funnel shaped.

**Archelirion.**—Flowers open, with deeply spreading segments.

**Isolirion.**—Flowers erect, falcate.

**Martagon.**—Flowers pendulous, and falcate.

**Notholirion.**—Stigmas distinctly trifid.

#### CARDIOCRINUM.

*Lilium cordifolium* is the type of this section. Its sub-species, *giganteum*, was first flowered by Messrs. Cunningham, Fraser and Co., Comely Bank Nurseries, Edinburgh, in 1852. The plants, which were raised from seed received five years previously, attained a height of 10ft in an open border. This is a common plant in the damp forests of the Himalayas, where it grows in a rich black mould, the bulbs being always close to the surface. From its stem musical pipes are made by the natives. *L. mirabile* has a centrifugal inflorescence, a character previously unknown in the genus.

deep violet. *L. Lowi*, incorrectly called *L. Bakerianum*, has a somewhat similar flower, but a dwarfer habit. *L. Bakerianum*, which was first described by Collet and Hemsley (Trans. Linn. Soc.) from dried specimens collected by Collet, produces two flowers, copiously brown-spotted on the inner basal half, and on erect peduncles. In character it is intermediate between *L. dauricum* and *japonicum*, with flowers resembling *odoratum* in shape. These three species are very slightly different.

*L. longiflorum* and its varieties are useful plants either for greenhouse or beds. The variety *multiflorum* is the best, and rapidly is superseding the "Bermuda Lily" (*L. l. Harrisii*). *L. Browni* has more scattered leaves, and a purplish tint on the exterior of the perianth; its varieties *Choloraster*, *platyphyllum*, and *leucanthemum* are all worthy of extended cultivation. The latter variety (*leucanthemum*) is erroneously called *japonicum* var. *Colchestræ*. *L. japonicum* and its variety *Alexandra* differ but slightly from *Browni*. *L. rubellum*, a rosy pink species, deliciously fragrant, should be in every collection, its flowers being produced in May, and are very acceptable, coming in after the spring flowering bulbs are past. Forming a connecting link between this section and the *Martagons*, we have *L. primulinum*, a pale yellow form, introduced in 1890.

(To be continued.)

## Credit.

BY THE MAN WHO SERVES THE KITCHEN.

I had just thought out my subject for this artikel, Mister Heditor, and had ritten the 'eadline along the top as usual, wen th' missus spied me.

"Jim," she said, in a rasping voice that sounded like a band saw at full speed, "I'll ha' none o' that. Credit's a thing as I allus set my face agen, and all the years as we've bin marrid I never would ha' anything to do wi' it, but allus paid iverything as we owed of a Saterdag night, as soon as you come 'ome wi' th' brass, which is more than some wives can say, as gets things on tick reg'lar, and for you to begin to rite to th' jernel about credit is a refleekshon on me, and I won't 'ave it, so there"—and by way o' emfasiss she took 'old o' wot few 'airs is left on th' top o' my 'ead, and give 'em a smart rench.

It took me some little time to drive it into her that the credit as I purposed riting about had nowt to do wi' runnin' up bills, getting things on strap, and all that soart o' thing; but that there was another kind o' credit, which is th' credit due to th' 'orny 'anded sons o' toil, as does th' real work in gardens; an in ritin this artikel I posed as th' champion o' garden laberers generally, and kitchen garden men in partiklar.

"Jim," says th' old girl, as she looked at me, kind o' sideways, wi' a smile similar to that which (barrin the rinkles) used to set my 'art flutterin' in our coortin days—"Jim," says she, "you're a geenis, and if ivver th' day comes when a garden labour candidate sits i' th' 'ouse of commons alongside o' John Burns, why, you'll be the man. I allus thort as you were born for summat better than kitchen servin'."

I let th' old woman ramble on, and now as she's gon' to attend th' mother's meetin' at th' vicarage, I can get on wi' my skribin'. I'm tempted to take up this subjeck, Mr. Heditor, 'cos in reedin' artikels in th' gardenin' press, ritten I guess by gardiners ('ead gardenirs, I mean), I notis that there's a very big "I" runs through most on 'em. It's "I" do this and "I" do that, till one really begins to wonder wot th' chaps occupys their time with as gets sixteen shillin' a week and dines in th' pottin' shed.

Now I ain't got a word to say agenst 'ead gardeners as a class, but wen they're diskussin' their triumphs it would be just as well if they wouldn't use that "I" quite so much, and giv' a bit o' credit to th' 'umble labourers; and wen anythin' turns out a failure they needn't be quite so hangshus to impress on their friends that it was all owin' to a blunder on th' part o' one o' th' men.

Bein' a man o' contented mind, it's most amusin' to me when our 'ead gardener walks round wi' th' lady, takin' no notis o' your 'umble servant, p'raps on my knees in a Salary trench, wi' one eye and both ears open, listenin' to th' way in which he enlarges on his kitchen garden management, but rarely do I 'ear a word as refleks any credit on Jim.

I wonder sometimes where gardenirs 'ud. be wi'out th' labourers, spechully them young 'uns as is brought up under glass like a forced Cowcumber, and arter doin' a few years o' jurnyman-ship and developin' inter forman they bust inter bloom as full-fledged gardeners, "well up in kitchen garden manijment," as th' advertisements say. I've 'ad one or two o' this kind to deal with in my time, and they begin o' tellin' me as they thought o' makin' me a kind o' kitchen garden foreman (but said nothin' about th' wages risin' along wi' th' soshal position), and o' course, bein' a foreman (wi' a couple o' lads under me), I should be responsible for my department. A grand chance for me, I thought, but said nowt, and certainly I didn't 'ave much interference till th' young boss saw 'ow I worked me gaarden and kept kitchen supplied, arter which he began to take quite an interest in vegetabels, and proposed that we should do this or do that till at last I began to see as I was a foreman in nothin' but name, ek-sept when th' missus complained o' th' cook grumbled, and then in a quiet corner o' th' Onion bed I was given to understand wot my responsibilities was. You may take my word for it that labourers has taught gardeners more than th' latter is prepared to admit when they get together at th' refreshment bar at a flower show.

They tell me that th' old preemium sistem is mostly done away wi', but never 'avin' 'andled eny o' th' fivers paid by young gardeners for their two years' instrukshun, I can only speak from 'earsay. At th' same time, I've 'ad to do wi' th' instrukshun part o' the business. We had a 'ead gardener once who was a mark on preemiums. He wanted to keep up th' callin' o' gardenin' to a high level, he said, and was mighty partiklar never to take a yonth unless he was prepared to fork out his preemium o' five pound or so. It was most important, so th' 'ead gardener said (after he'd got his fiver) that youths should be well versed in th' rewdiments o' kitchen gardenin', so by way of a start they were sent along o' me for a year or so, arter which they were promoted to pot crockin', and so on till they got charge of a greenhouse all on their own, and wen dressed up of a Saterdag n't they 'ardly knew Jim. Some of 'em took to gardenin' all right, and others might ha' saved their five pounds; but I've often wondered how th' 'ead gardener earned his money. If they larnt anythin' in th' kitchen garden I reckon that I did th' teachin', and once wen I

mildly suggested somethin' reward I was informed that th' receevin' o' premiums was one o' the privileges of a 'ead gardener's position. Wot I say is, that if it 'ud 'a bin any lowerin' o' th' gardenin' perfession for me to receive any o' th' preemium, I think I might ha' be'n given credit for some o' th' tooterin', and I say the same for my feller kitchen garden men of similar expeerience.

My contension is, Mr. Heditor, that a kitchen garden man ain't a hordinary labourer. Th' 'ead gardener may be a good vegetabel grower, or he may not; but th' responsibility o' th' kitchen garden man remains. Wen he goes 'ome o' night he may leave his work behind him; but he can niver resine himself to th' arms o' morpheus and rest his 'ead on th' pillar wi'out wonderin' wether slugs are makin' themselves fat on th' seedlin's as he's pricked out that day, or whether th' blite ain't settlin' 'is Potaters. Agen, it falls to 'is un'appy lot to keep th' peace atween cook an' 'ead garden'r, and, in short, to be the real motive power that keeps th' kitchen garden macheen a-runnin' smoothly.

We'll say that eighteen shillins' a week is th' average wage for a kitchen garden man, which no one can say is a princely sum, though, mind you, I ain't complainin' about wages. Credit's the thing I'm plumping for just now, credit for a class o' men as is largely responsible for th' teachin' o' young gardeners and releevin' 'em o' much anxiety wen they're matoored, an' if I raise my voice on behalf o' my feller workers it ain't done in a contentious spirit; all we want is fair do's and no favour, but there, I hear a meshured footstep on the cobbled stones as leads to th' front door o' my domestick establishment. It's th' missus returnin' from th' mother's meetin', so I'll stop as she's sure to have a few choice bits o' gossip for me when she gets in. Mothers' meetins is rare places for news.

## Violets, Princess of Wales and La France.

"The most beautiful single Violet," says the author of "Sweet Violets and Pansies," "is undoubtedly that named Princess of Wales." This variety is a very vigorous grower, good for the open border, and should be allowed plenty of space for its large leaves to develop, 3ft each way being none too much for the young plants in spring, for they need it all (if generously treated) ere the time for planting arrives in September. They may be placed into stout, drip-proof frames, or in open-air beds, but the frames are preferable. Pot culture is not so generally resorted to. It is of service to the "small man," whose accommodation is so limited that he must seek variety in ways that are economical, or for large gardens where pot Violets are sought after. Young plants may either be potted into large pots right away in April, or lifted and potted about the beginning of September, the after-treatment being such as ensures the coolest possible conditions, and, also, the avoidance of dampness, or, on the other hand, the least suspicion of dryness; and the plants must be in the enjoyment of full light. It is not absolutely necessary that they be within a few inches of the glass, though in frame-culture this is advisable. The Sweet Violet requires a perfectly pure atmosphere.

Princess of Wales was introduced a few years ago from Hyères. The flower is almost Pansy-like in size and appearance, of a lovely blue, and both strongly and sweetly scented. The stems are often 12in long, and if there is space for only one Violet in the garden, Princess of Wales should be chosen.

Some keen growers of Violets have objected to the rampant leafage of this variety, and its unnecessarily long stalks, but while La France, for instance, is neater and tidier, it does not throw so many flowers, and, of course, that is not what is desired. As a pot Violet, none will beat Princess of Wales, and Mr. Brotherton, in a note to the *Journal*, page 36, July 10, 1902, says that it flowers with him in pots during the summer (June and July). In the note referred to, he adds: "In addition to flowering so late, it is possible, by allowing the runners to grow after the plants have been housed in autumn, to secure a second crop of blooms from these, flowers being produced from the axils of each leaf." We would welcome short notes on Violets at this season.

The second variety (and which is figured about half natural size), is also deliciously fragrant, and of a deep blue colour. The flowers are over an inch across. Some growers, of course, favour this in preference to the other. It also makes a good pot or frame variety, and is very generally grown.

The inclusion of Violet classes at winter exhibitions is very commendable, and at the small shows frequently held by mutual improvement societies, the Violet generally receives attention.

THE GOLDEN-ORANGE and the crimson varieties of *Celosia pyramidalis* are always used to grand account mixedly in borders by themselves in Hyde Park, and the edging is of mossy *Saxifraga*. A bed of *Lilium speciosum album* is choice, and the mixed beds of foliage and flowering plants are at all times beautiful.

## Notes on Hardy Plants.

### *Primula frondosa*.

Some time ago I drew attention to the fine *Primula rosea*, one of the most brilliant of our hardy Primulas. The one I desire now to notice is very different in its attractions, inasmuch as it is not what we can call a showy flower, but one which has yet many points of beauty to commend it. It is, however, mentioned as being linked to *P. rosea*, not closely botanically, but by reason of its doing well under almost similar conditions. Not that it requires so much moisture, for it is more accommodating, and will thrive and flower well in a drier position, especially if shaded.

I find, however, that it is more vigorous, increases more freely, and flowers better when in a place where its roots are constantly wet, such as the margin of a pond or stream, where the moisture is always in contact with its roots. My attention was first drawn to its likings in this respect by seeing a group in the rock garden at the Edinburgh Royal Botanical Gardens, where the plants which were most shaded from the sun were the most vigorous. A desire, also, to test an impression growing in my mind, that the farinose Primulas preferred more moisture than the others, led to testing this pretty little Balkan Primrose in a sunny position on the margin of one of my Water Lily pools. The result has been very satisfactory, the large plant now there being finer than one in a shaded border which is comparatively well drained and free from standing moisture. One desires, however, to state that the experiments with the farinose Primulas are not yet exhaustive enough to confirm or refute the idea that all like so much moisture, although *P. frondosa* certainly does.

*Primula frondosa* is, as one would think, very properly included in the section Farinosæ by Dr. Ferdinand Pax, in his exhaustive monograph of the genus *Primula*, of which a good English translation would be a great advantage to English-speaking admirers and students of the genus. It is thus classed along with the following species—*involutrata*, *sibirica*, *pumilio*, *egallicensis*, *Olgæ*, *longiflora*, *scotica*, *stricta*, and *farinosa*. It is very liberally supplied with a white farina, which not only covers with a beautiful silvery whiteness the under part of the leaves, but generally extends, though less plentifully, over the petioles, a portion of the upper surface and the midrib. The stems and pedicels of the flowers are also covered with this flour-like farina.

The flowers themselves are individually small, but are fairly numerous. They are called blue, I observe, in one work, but one cannot say that they are anything but purple or purple-rose. The leaves, which are, as the specific name of *frondosa* would indicate, numerous, are narrowed to the petioles, and oblong or lanceolate. The plant, as grown in Edinburgh and that in my own garden, agree with the work of Dr. Pax, already referred to, and also with Widner's *Die Europäischen Arten*

der Gattung *Primula*, a very complete account of the European Primulas, but differing in the names of its classes from Dr. Pax's, *P. frondosa* and others being classed under the section Aleuritica.

This season *P. frondosa* has come earlier into bloom than usual, but its flowers generally open here during the month of April. It is a pleasing little Primrose, peculiar to the Balkan Peninsula, and perfectly hardy with us.

### *Veronica virginica*.

Veronicas are notoriously difficult to name with any certainty, and the herbaceous section presents fully as many difficulties as any

other, especially seeing that these plants vary much from seeds and hybridise freely. In the case of *Veronica virginica*, we have, however, one which is very distinct and easily identified by those who have seen it once or twice. It has, indeed, been separated by some botanists from the genus *Veronica*, and has shared with another *Veronica* the possession of that called *Leptandra*, Nuttall being the authority for the distinction. The great "Index Kewensis" follows Linnaeus in calling it *Veronica virginica*, but we find that Britton and Brown in their valuable "Illustrated Flora of the Northern United States and Canada," follow Nuttall and describe it as *Leptandra virginica*. Whatever the ultimate decision of botanists, we may well for garden purposes content ourselves with the old and familiar name, for it is a *Veronica* to all intents and purposes, and so easily identified that there is no gain by giving it generic rank.

*Veronica virginica* is one of the most ornamental of the herbaceous species, and is a really handsome plant when occupying an isolated position in the border or associated with dwarfier plants, so that its handsome proportions and its fine verticillate foliage can be fully displayed. Even before it flowers it is admired for its habit, and when the tall stems, decorated with their fine serrulated leaves, are surmounted by the fine spikes of flowers, the whole effect is striking in the extreme, especially when the plant is a well grown one, and reaches a height of 6, 7, or even 8 feet in height.

The colour of the type is often described as white, but it is frequently bluish in its native habitats, which are in meadows, moist woods, and thickets throughout a great part of Eastern Canada and the Eastern United States. Some nice varieties have been raised, and one of the prettiest and most ornamental I have seen was raised or selected by Rev. C. Wolley-Dod at Edge. I have practically discarded the others in favour of this one, which has fine spikes of lilac-blue flowers.

One advantage of this *Veronica* is owing to the fact that it is so easily cultivated as to grow in almost any soil, though, of course, it attains more impressive stature when growing in a strong and moist one. In the ordinary border it is not always possible to give it as much moisture as it would like, but there it ought to be well manured with farmyard or stable manure, and have also humic matter.

For wild gardening it is well adapted, but the timely staking it may require in exposed places is not always informal enough in appearance for this form of gardening in its highest phases. There is no difficulty in the propagation of *Veronica virginica*, as it is easily raised from seeds or increased by division of the roots in spring or autumn. The best forms should be propagated by the latter method, but cuttings of young growths in spring and summer can also be readily struck, especially if a gentle heat is at command. Like many other plants this *Veronica* has its "popular" names. One of these is "Culver's Root," but it has also been known as "Black Root," and as Culver's

Physic.—S. ARNOTT. [A short notice on other of the herbaceous Veronicas appeared in our issue of last week, page 529.]

### Plant Perfumes.

The perfumes of certain flowers affect the digestion or breathing, or cause dizziness, and even fainting fits. Vanilla is troublesome to many, so is the white flower of the *Ligustrum japonicum*, and the *Pittosporum*. The Tuberose, Jasmine, and Lilac are objectionable to some. The *Datura arborens* makes people drowsy. This action of flowers is due to the scent, and is distinct from the influence of pollen, which produces hay fever.

Violet, La France, in a pot. ( $\frac{1}{2}$  nat. size).

## Modern Progress in Horticulture.\*

"There never was a period when the science of gardening was so universally and so ardently cultivated as it is at present." This statement is as true to-day as it was when Speechly wrote it in the preface of his celebrated treatise on the Grape Vine, published in 1790—over a century ago. We must never forget, however, that individual opinions are apt to be rosy or drab, according to the good or bad position or circumstance in which the individual who expresses them is placed for the time being. Environment influences men's judgment, as it also does many other things. The highest point to which any art or craft can rise is not altogether expressed by the highest and best results attained by any one gifted individual, or even by a small set of individuals, but rather by the highest average excellence attained by the whole community. When we try to judge of horticultural progress, we must be clear as to what the main premises really mean. We may also ask if garden progress has risen all along the main trunk or line, or whether some particular branches have not been improved and elevated to a higher standard than others.

Well, on the whole, I think that *upward* progress in all ways, however great, has really been *less* than is generally supposed, and that what many call progress is rather a *wider diffusion* or outspreading of good culture. In a word, we have probably a hundred good gardens to-day for every ten good gardens of fifty years ago, this increase being due to improved trade, better education, and other social and economic conditions. The richest people in England to-day are not all aristocrats and landlords, and many of our best present-day gardens really belong to merchants and others connected with our manufactures and export or import trade. When we look at the particular branches of horticulture we find that there is nothing stable: everything is in a transition stage as the years go by. Broadly speaking, it is best for horticulture that fashion and tastes, or hobbies, should thus change from time to time. It brings into focus new things, new interests, and affords opportunities for new and able men of all classes. In the garden there are certain products that nearly all *must* have, such as fruit and vegetables and hardy flowers; and then there are things which middle-class people *may* have, ending at the top of the ladder with horticultural luxuries which only the rich *can afford* to grow or otherwise obtain.

In exotic flower culture especially, change has been and is still rife. Gone are the huge and more or less complete collections from most, if not actually all, large nurseries, because they are no longer popular in private gardens—Ericas, Cape Pelargonias, Ferns, hard-wooded plants from the Cape and Australia, and many other special things. "Bedding-out" is much modified, and the growth of elephantine exhibition plants has nearly ended to-day. Even the so-called "florist's flowers" as florist's flowers are on the wane; so also with hybrid perpetual or "show Roses," so-called, and many other once popular things.

Of course these things still exist, and the best of them are often grown far more largely than before, but not for exhibition purposes. In a word, gardening has been, and is, very largely influenced to-day by a deep and healthy and much broader public taste than ever before in our history. Cultivated and artistic people do not like to see show Roses and Chrysanthemums stuck hard and fast into stiff wooden boxes, nor Pansies and Carnations in paper collars to-day. We can most of us remember how the late John Gibson, of Battersea Park, modified the bedding-out arrangements there by what has since been called sub-tropical gardening. Then we had the still existing change in favour of hardy herbaceous and rock or Alpine flowers.

The Narcissus hobby, again, has occupied attention for years, and still exists, even if perhaps a little less fervently than a year or two ago. The Iris, the Pæony, and the Viola have had and retain popularity, just as did the Auricula, the herbaceous Phlox, the Hollyhock, the Anemone, the Ranunculus, the Pansy, and the florist's Tulip before them. We had hardy wild gardening as an improvement on half-hardy sub-tropical bedding, and now many are practically expressing a taste for flowering trees and shrubs, for Bamboos: indeed, the Bamboo garden, or "Bamboosery," the pergola, the water-garden for choice coloured Water Lilies and other aquatics, and the moraine bed or border seem present-day rivals of the pinetum and the wire temple roseries of other days. We have had a Sweet Pea and a Dahlia revival, and now that Daffodils, excepting the best, of course, are on the wane, we are to have the Garden Tulip as a coming flower.

Plants of to-day must be decorative or both beautiful and useful *selections*, and not merely formal or curious *collections*, and, as often happened in the past, both difficult and expensive to cultivate. Owners of gardens to-day do not emulate the botanical gardens, as did those at Woburn, Chatsworth, or Knowsley in days ago; and for this very reason our botanic

gardens, with their full collections, hold an interest for us now that they scarcely ever held since the early history of botanical gardening began. Selections useful and beautiful *versus* collections curious and rare are the order of the day. Very few country gentlemen now ever think of planting a "pinetum," as so many did fifty or more years ago; and still the best of Conifers are sold in much larger numbers to-day than ever before. This eclectic taste is true of other things. As a matter of fact, we have to-day better and more catholic tastes at work, and *the many* have now acquired the taste for planting and gardening formerly confined to *the few*. Even the poorest cottagers and allotment labourers to-day may possess a bit of garden if they care to do so.

Amongst the most potent factors of change and progress in nursery management, so far as imported Orchids, bulbs, &c., are concerned, have been the public or auction sales held in London, Liverpool, Manchester, Birmingham and other large towns. The expenses and risks of collecting abroad and the lowering of prices consequent on competition both at home and on the Continent, as combined with the effects of auction sales, have revolutionised the nursery trade formerly done in these exotics and other plants. The price of all nursery stock is lowered sooner or later by auction sales; but in the case of trees and shrubs, hardy plants, and Dutch flower roots the effects are not so apparent, as the widespread public demand is so enormous. In the case of Orchids, however, for which the demand is comparatively limited, the effects were more immediately seen. As a consequence Orchid collecting has been left in the hands of those who import expressly for sales by auction, and one result has been that those who can pay for glass houses and fuel, and afford the necessary attention and labour, may grow Orchids if they care to do so. An enormous influx of new and beautiful home-raised seedlings and hybrid Orchids is another result that has been encouraged by auction sales. In other words, new Orchids are now being raised by the thousand under glass roofs beneath an English sky. In this way the nurseryman can protect himself and his creations.

Good and beautiful as is the best of professional gardening in private places and nursery gardens, I think I may safely say that the greatest *upward* horticultural progress has been made of late years in market gardens, and especially those in which large areas are covered with glass, and having all the modern "resources of civilisation" in the shape of appliances for hastening, retarding, or otherwise growing and utilising fruits, vegetables, and decorative plants and flowers. These glass-roofed market nurseries exist near all our large towns, and they extend from the Land's End to John o' Groats. I never look over one of these extensive glass-roofed gardens—like Rochford's at Old Turnford—without saying to myself that the demands of Covent Garden and other large markets have led to some of the most remarkable phases of horticultural perfection, both practical and economic, ever seen in British horticulture.

We all know the dictum of Adam Smith, who, in writing his celebrated "Wealth of Nations" in 1776, said market gardening was a poor calling, because nearly all persons able to purchase garden produce were also able to grow their own supplies. This was probably quite true at the time, but the growth of large towns and manufactures, the increase of population, &c., have altered things, and to-day, not only is there a good open market for edible garden produce grown in England, but for imported fruit, vegetables, and flowers to the annual value of many millions of pounds as well. To grow all our own cereals, meat, and milk products, and even our own poultry, eggs, and honey, may be impossible—I do not say it really is so, but we certainly ought to be able to grow a far larger proportion of fresh fruit, vegetables, and flowers than we now do.

High and able as is the cultivation in our best of private gardens throughout Great Britain and Ireland, it is to the market gardeners that we shall have to look for the greatest success in British horticultural practice and methods. The reasons are many, but the main point is that gardening is in most private places a matter of taste: the personal equation of the owners comes in largely, likes and dislikes being many and varied. Many private gardens having both grounds and glass houses well arranged may be economically managed, but there is often a good deal of sentiment connected with them, and they are often badly arranged and are kept up just as horses and hounds, or yachts and motor-cars, and other luxuries are kept up, viz., for personal rather than for economic reasons. With the trade or market gardener cultivation is purely an economical question, and he arranges things so as to save labour, and he produces, not what he likes best himself, but that which sells best, or the things he can grow at least cost and sell for most money.

(To be continued.)

### *Lælia autumnalis.*

The pseudo-bulbs are much wrinkled, ovate, and produce two somewhat linear, coriaceous leaves. Its rosy-purple flowers, nearly four inches across, having a pale-coloured or white lip, are borne on an erect long scape. This Mexican species somewhat closely resembles *L. crispata*, a Brazilian species, but is more slender in all its parts.

## NOTES

## NOTICES

**Appointment.**

Mr. A. Grant, as head gardener to Lady Price Fothergill, Hensol Castle, Pontyellun.

**A National Potato Society.**

In view of the enormous advance in the price of Potatoes this season, the heavy losses from disease, and the importance of the crop, a project has been mooted for establishing a National Potato Society. A public meeting will be held in the North Room, Hotel Windsor, Victoria Street, Westminster, on Wednesday, December 30, at 3.0 p.m., to fully discuss the matter.

**Sending Flowers to the Continent.**

I have frequently heard of difficulties experienced by flower collectors abroad in posting plants or even blooms only to friends in England, and there are countless tales of confiscation by custom-house officers in consequence of temporary regulations forbidding the practice, because innocent-looking parcels labelled "flowers, with care," too often "contained contraband lace." The latest complaint, says a writer in "News," concerns flowers posted in England. A correspondent writes:—In case any of my countrymen in England have an idea of sending over a few flower roots as a present to friends in Germany, they may perhaps profit by the information afforded by the following account. A few days back a small box of about a dozen Violet roots was sent over to Germany as a present to an English lady who wanted a few home flowers in her window box. For this 1s. 3d. was paid for postage, an explanatory letter being sent separately. The lady writes in reply:—"When the notice came that there was a parcel they would not let us have it, saying they would not allow it to go out of the office, fearing an infectious disease. They informed us that the roots must either be burned there or sent back to you. I asked if I might be allowed to bring away the little bit of the lid on which you had written, and after many serious head-shakings they said yes, and actually took up the lid, brushed it well on both sides, and blew on it also." [Are really healthy plants forbidden?—ED.]

**Agricultural Experiments at St. Andrews.**

At the meeting of the St. Andrews and East of Fife Farmers' Club on Monday, Dr. John H. Wilson, lecturer on Agriculture in the University, gave a lecture on the results of the continuation of his experimental work during the past season. He had cultivated many varieties of Potatoes of his own raising, and found extreme variability amongst seedlings from one and the same fruit, in respect of form and colour of tuber and flower, length and duration of stem, and cropping power. A good many of the seedlings were not proof against disease, but the majority seemed disease-resisting. No means had been taken to shield the varieties from attack. In a large series of crossed Swedes, many of the varieties had proved to be of most promising character, more especially those having Sutton's Magnum Bonum as seed parent. Visitors to the plots had been much struck with the uniform excellence of a cross between that variety and Crimson King. The crosses between Swedes and yellow Turnips, which had flowered during the past season, showed great diversity of seed-bearing power. In certain of them, the plants had refused almost entirely to bear seed, and had consequently continued to branch and bloom for a long time. Other crosses, however, had produced abundance of fine seed, and it was hoped that the very desirable intermediate types of roots shown by the parents might be fixed and perpetuated. The hybrid characters were seen in the flower and capsule as well as in the root. An elaborate and expensive experiment, to test the characters of hybrid Oats which were of much interest in the first generation last year, had been seriously interfered with by the deplorable weather experienced in the past autumn. The results so far worked out showed that Oats were subject to the same principles of variation as had been demonstrated for other self-fertilised plants. In conclusion, illustration were shown of Ergots disseminated by flies, and Finger-and-toe perpetuated by Charlock. A new disease of Potatoes established in Fife was also shown. It is characterised by the formation of loose corky tumours on the tubers.—("St. Andrews Citizen").

**United Horticultural Benefit and Provident Society.**

The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last. Mr. Thomas Winter in the chair. Four new members were elected. Eight members were reported on the sick fund. The attention of members is particularly called to Rule 14, a member having just now forfeited his sick pay through neglecting to pay his subscriptions within the limit of seven months.

**Farm Colonies for London's Unemployed.**

From Poplar, a district in the north of London, we hear of a recommendation to deal with unemployed married men who possess homes in London. These homes are to be maintained unbroken if the men will at once go to work in the country. Mr. Crooks, M.P., says plainly, "Giving money to men as relief is pernicious—what is wanted is the opportunity to earn a wage." A plan running on similar lines received influential support at the Mansion House. The Bishop of Stepney wishes to see a thousand married men set to work on farm colonies at Hadleigh, Lingfield, and Osca Island; and the conference of citizens appointed a committee to arrange details for carrying out the scheme. Public support should not be wanting; and if the able-bodied men now in the workhouses are willing to embrace the opportunity of returning to work on the land, the result of their labours will be watched with the keenest interest.

**Miniature Rifle Clubs.**

One of the most popular rifle meetings of this year was that of the Society of Miniature Rifle Clubs, held at the Crystal Palace, from March 23 to April 1. It attracted nearly 3,000 entries, and was a pronounced success. Unfortunately, however, the Council find their funds so low that they cannot guarantee a repetition of the meeting next spring. This is disappointing, seeing the importance now attached to rifle shooting as a means of national defence, and the Council earnestly appeal for financial assistance. The Society is incorporated with that of the "Working Men's Rifle Clubs." Those who can assist it should send their subscriptions to the Secretary, Society of Miniature Rifle Clubs, 17, Victoria Street, Westminster, S.W.

**Baron Sirj Henry Schröder and "the Hall."**

Baron Schröder writes:—"The new hall of the Royal Horticultural Society—so anxiously desired by the Fellows—is now in course of erection, and will, the Council hopes, be completed for use by mid-summer next. The total cost of the hall, offices, library, &c., including furniture, will be about £40,000, and the Council, of which I am a member, are most anxious to open the building free of debt. Towards this sum £23,000 has been contributed, of which no less than £8,471 has been given by the Council and officers of the Society. There thus remains a balance of £17,000 still to be raised. At present only about one in ten of the Fellows has contributed to the building fund. In the hope that the others will see their way to do so I have been asked to make this appeal. If every Fellow would kindly forward a contribution—some giving more and some less—the desired object would be attained, and the anxiety of the Council on this point at an end.—J. H. W. SCHRÖDER, 145, Leadenhall Street, London, E.C."

**Autumn Flowers at Oakbrook, Sheffield.**

For the past few weeks the gardener at Oakbrook, Mr. P. Massey, has had such a show of bloom that he may well feel some sense of pride in. At the time of our visit there was a magnificent batch of Calanthes, some spikes having 50 flowers, with others to follow; and with the pots disposed amongst Ferns and foliage plants, they had a grand effect. We also noticed Poinsettias, and a noble piece of Eucharis, with some 50 or 60 flowers. A notable feature is also what may be termed a truly royal display of Begonia Gloire de Lorraine. There are scores of plants in four-inch and five-inch pots, and in various stages of advancement, producing a veritable blaze of colour, these alone repaying one for a visit. The grand collection of Crotons is again deserving of notice; for colour, style, and variety they are certainly not to be equalled in the district. Particularly noticeable are two grand specimens of Leedsii. The conservatory, too, is a mass of flowers. The roof is profusely adorned with Cobaea scandens variegata, and below are Cypripediums, Narcissi, Bouvardias (a grand lot), Salvias, and Chrysanthemums in all varieties and colours, while in a cool house there is a very large batch of Cyclamens to follow-on for a succession of blooms. These are such that no one could wish better. The profusion of flowers that they are now throwing assures one that it will be a distinct treat to see them later on.—W. L.

### New Incurved Varieties.

Desirable additions to the incurved section of Chrysanthemums are nowadays of such rare occurrence, that when a really meritorious variety is introduced it is certain of a warm welcome. The following I can recommend to any cultivator with even a limited collection.

George W. Matthew has a bronze yellow base with a clean amber yellow centre. The petals under some methods of culture are a trifle loose.

Mrs. W. Higgs in colour is silvery pink, faintly margined with rose. The full sized blooms are solid and of perfect form, quite a promising variety. William Higgs has massive proportions, building up a full globular flower. In colour it is golden fawn.

Mrs. Barnard Hankey in colour is chestnut with a deep red suffusion and stripe. It is a massive deeply built flower of excellent proportion. Miss E. Seward is a promising addition, the somewhat narrow pointed florets incurve perfectly. The colour is pleasing—bronze base with a rich yellow centre.

Miss A. Dighton has exceptionally long narrow florets which incurve perfectly. For an incurved variety it is extra large. The colour is pleasing—primrose yellow. Mrs. Frank Hannaford is best described as a much improved Major Bonnafon.

C. Blick I look upon as too much like a Japanese in every way. Its proper position is undoubtedly with the incurving Japanese section. The petals are too long, loose, and incurve too irregularly to belong to the incurved section. The colour is pleasing—pink, faintly striped with purple.

Mrs. C. J. Mee, should be in the same category, rose lilac. May Phillips in colour has a rose base with cream yellow centre. The florets are narrow, incurving thoroughly, making a full, large flower, in every way satisfactory. The King is most peculiar in colour—slate, with a purple suffusion. The petals are closely built, forming a deep flower.—E. MOLYNEUX.

### New Japanese Varieties.

Mr. J. Martin has pointed petals, semi-reflexed, in colour it is rose, lined with terra-cotta, with a golden reverse. Miss Olive Miller, although not absolutely new, is not so well known as its merits deserve. The medium sized flat florets droop gracefully, building up a full solid bloom. The colour is quite pleasing—rose pink.

George Lawrence has long narrow drooping florets. In colour it is orange, suffused and lined with bright terra-cotta, golden reverse.

Mrs. F. W. Vallis is quite one of the finest of new introductions. The florets are extra long, droop gracefully, and form a massive flower fully 8 in. deep. The colour is decided crimson, suffused with apricot yellow, with a golden bronze reverse.

Florence Penford belongs to the incurving type of Japanese. The medium sized florets incurve closely. In colour it is amber, with light bronze stripes and a rose suffusion.

Rose Portevine has short broad petals of a charming soft rose colour. Souvenir de Père Calvat is pleasing in colour—soft pink, with rose and cream suffusion.

Countess of Arran has strap shaped florets building up a flower fully 9 in. in diameter. The colour is attractive—soft purple, deepening at the edge.

Countess of Harrowby. The florets are long, semi-drooping, with twisted points. The colour is effective—white, with a soft rose suffusion and defined edging of same.

Phillipe du Cros is of medium size, a capital decorative variety. The narrow florets are chestnut red on the surface, with a flush of yellow. The reverse is gold.

Lady Mary Couzens reminds one of Mrs. Barkley in style of flower; the florets are not so wide as in that variety. The colour is quite distinct—rose, mottled white.

W. Preece is rich yellow in colour, with closely incurving florets. Fairy Wreath was raised by Mr. C. Shea, and is most pleasing in its colour—soft cream, with stripes and flushes of rose. The semi-drooping florets are broad and flat.

F. J. Taggart belongs to the hirsute or hairy section of Japanese. The rich yellow colour is very attractive.

Mrs. C. M. Paige belongs to the incurving section of Japanese, and is an improvement upon Mons. Debric—warm pink in colour.

Dora Stevens favours M. Chenon de Léché in formation. The florets, however, are a trifle narrower. In colour it is rose terra-cotta, with bold reverse. A full promising variety.

Dora Payne is a sport from Miss Lucy Evans, and a promising variety too. The flowers are deeply built, with medium sized florets. The colour is distinct and pleasing—rosy cerise.

Lady Cranston. This is indeed a decided acquisition to an already long list of varieties. It is a sport from Mrs. Barkley; the florets are fully 6 in long, some 1 in wide; they droop in a graceful manner forming a grand bloom. The colour is pleasing—faint rose in the centre, gradually fading to white at the tips.—E. MOLYNEUX.

## The Colchicums or Meadow Saffrons.

Just as hardy Cyclamens are greatly overlooked by many who have charge of outdoor grounds, so, too, are the autumn and winter-flowering Meadow Saffrons—the so-called “Autumn Crocuses.” Mr. Arnott points out how large quantities of corms can be cheaply procured from home-sown seeds, in the following paragraph, and possibly this may induce an attempt in this direction—and the work, we can guarantee, is interesting. The best planting season for mature corms is August, and the species we figure (*C. autumnale* and *C. variegatum*) are two of the best known and handsomest.

Although the raising of Colchicums from seeds is a somewhat tedious process, seeing that one has to wait three or four years before flowering corms are produced, it is a cheap way of securing a stock of the more expensive species; while, at the same time there is always the chance of obtaining a valuable break from the normal species. The seeds, if saved from one's own plants, should be sown as soon as ripe, though they may also be kept until spring if necessary, although practically a year will be lost by this, unless they are sown early in heat, which I do not advise. The seed pods should be gathered when about ready to open, as if allowed to open naturally, some of the seeds will inevitably be lost. The sowings may either be made thinly in a bed of soil under a frame or handlight; in pots or pans in a cold frame; or simply in the open ground. In the last case the seeds may be about half an inch under the surface, but if in shelter a little less will suffice. The leaves should appear the spring after sowing, and, beyond giving plenty of air after the seedlings appear, and water, if under glass, no other attention will be required.

When the leaves ripen, an inch of soil may be added. The next season the same process may be adopted, but if in pots or pans the corms should be transferred to the open ground as soon as the leaves die down. I prefer to sow in the soil—not in pots or pans—and to allow the corms to reach a flowering size before disturbance. Thin sowing is necessary for this. As a rule the seedlings should never be dried off, and a golden rule with the Colchicums is to disturb them as seldom as possible.

Unless a large number of corms are required it is not worth while to raise the common *C. autumnale* from seeds, but the finer species will repay the trouble.—S. ARNOTT.

WINTER-FLOWERING COLCHICUMS.—“The Garden” of last week had the following notes by W. Irving:—“Although the majority of the more familiar Meadow Saffrons flower in the autumn, there are a few exceptions, and from the countries of the East we get some species which do not bloom until winter or early spring. Belonging to this section are the following three species, which at the present time are in flower. *C. libanoticum* is found near the summit of the mountains of Lebanon in Syria. Resembling *C. montanum* in general appearance, it differs in having broader and shorter leaves and yellow stamens, and also in its winter-flowering character. *C. montanum* not flowering till the spring. The two species differ also in the number of flowers produced from each corm, the latter having two to three with the same number of leaves, while *C. libanoticum* has four to five rather larger flowers, with broader segments and a corresponding number of leaves. The flowers range in colour from white to pale rose. Corms of this species were obtained from Palestine in 1900, flowering the same winter. *C. luteum* comes from the mountains of the extreme west of India, where it is found at an elevation of 7,000 ft in Kashmir and Afghanistan. This rare little plant is unique in being the only yellow-flowered species in cultivation. The size of the large corms is out of all proportion to that part of the plant produced above ground. About 3 in to 4 in high, with a slender tube and ovate perianth segments, the flowers are usually solitary, attended by two linear strap-shaped leaves. Introduced in 1874. Under the name of *C. Sieheanum* corms were received this year from Mr. W. Siehe, of Mersina. It is a pretty little plant in the way of the Hungarian *C. arenarium*, which it resembles in stature and in the colour of its flowers. *C. arenarium* is, however, an autumn-flowering plant, the leaves not appearing till spring. The present species produces flowers and leaves at the same time; it began to flower this year at the end of November. The flowers are of a rich reddish purple.”

A Colony of Meadow Saffrons

### National Economics.

In sending my contribution on National Economics, I deprecated alterations. You have confused the issues in relation to the 1,000 and 30,000 acres. No young fruit trees should ever be planted in place of old ones, nothing short of fresh acreages converted from arable or grass will suffice. Your editorial interjection as to Nature Study being taught liberally in Germany is not to the point. I do not aim at conventionalism merely, but let the young begin to learn to know their environment from a couple of years before that other strait-waistcoat—the three R's—are applied. These would be assimilated as in play after the preparation of their minds. In these lines I prophesy, Huxley's lines are my lines.—H. H. RASCHEN.

### County Council Instructors in Horticulture.

I see by last week's *Journal* that the list of the counties in Ireland that have instructors is not complete, as Kildare and one or two other counties have them. The Kildare Agricultural Committee was the first in Ireland to appoint an instructor (December, 1901). Last year there were five demonstration gardens in different parts of county Kildare, to show the best methods of vegetable and fruit growing, and these worked so well that all the counties having instructors have such plots this year. Again, last year the Kildare committee bought fruit and other trees in large quantities, to dispose of to persons in the county at cost price. This, again, has been taken up by other counties this year. The county instructors show the people the proper methods of planting and pruning, and suggest the best varieties of fruits to grow. During the winter (from October to March) lectures are held on five evenings each week, in national schools and other places, on fruit and vegetable growing, the attendance averaging about 100 at each meeting. Prizes are offered to the value of £126 for the best kept cottages and gardens in the county in 1904 by the Committee of Agriculture. Prizes have also been given for the past two years. There are also in the county three cottage garden societies holding shows about the month of July each year, for vegetables, fruits, flowers, poultry, butter, eggs, and cottage industries, in Naas, Athy and Celbridge.—Hortus., Co. Kildare.

### Making a Garden.

There is much that is interesting in Mr. W. Rowles's remarks on "Making a Garden" in your recent issues, but, as one of the young men, I am disposed to think that too much importance should not be given to garden plans. True, when a garden is already made, a considerable amount of interest can be obtained from drawing a plan of it, but the custom of drawing designs of proposed gardens are, to my mind, not wholly satisfactory. There are many who make a living at garden design drawing, chiefly ladies, and some of their works are utterly ridiculous, although looking pretty on paper. Moreover, many experts admit that it is folly to depend entirely on designs when making a garden, as many things are bound to crop up which the designer cannot have foreseen. To my mind, a man who has no artistic taste cannot hope to make a really pretty garden, plan or no plan, whilst to insist that all persons can draw one is quite fallacious. Draughtsmanship is inborn; teaching and practice only improve, and bring out the latent instinct. Were it not so we might all be a Seymour Lucas, or some other great artist.

Being now employed, together with an expert, in reconstructing a crude and badly designed garden of some age, I may say that not a single item has been put upon paper. Our system is simply to take a general aspect of each point, and conjure up a vision of what the effect would be were certain trees taken away or a hedge demolished, and a shubbery, borders, or banks, &c., put in their places. Having got the idea, we tackle the work personally, for we are our own workmen, and as each item is completed another idea crops up. Under this system a portion of a large lawn has been seized and converted into a shrubbery; a forest of Birch, Elders and Laurels, under a huge Poplar, has become a little wild garden, enclosed by rustic fences. A piece of sloping ground has become a sunken bed, the earth taken out being used for making up high banks fronted by stones. A dirty, weed-grown puddle, hedged in by rubbishy, neglected trees, is already becoming an ornamental pond with slightly sloping banks, which will be filled with plants that will flourish under the huge trees overhanging them. By our united efforts

it will take three or four years to complete the whole alterations thought of, but paper gardening is not resorted to until each section is complete, and then each border, &c., is sketched out and the various plants marked off in detail, so that should a label get astray we know exactly where to look for the name.—CUPID.

[We should be exceedingly sorry if Mr. Rowles's admirable instructions and advice were to be left unheeded, on the grounds that alterations can be successfully completed without the aid of drawn plans. The case cited by "Cupid" may work conveniently well where the operations are not undertaken by contract, but on large estates it is imperatively necessary to lay the plan primarily upon paper, to a scale, as with estimates.—Ed.]

### Red Spider.

Like your correspondent, on page 535, I, too, have something to add respecting the behaviour of XL All as a Vine fumigator. This autumn, spider insinuated itself in our late vinery. As the fruit was all but ripe, the application of water in any form was not advisable. Thinking that, on account of the advanced state of the foliage, any danger would be trifling, I essayed to try a dose of XL All. The vinery was planted with Muscats, Colmans, and Alicantes. To be on the safe side, I only applied a little more than half quantity, on the assumption that if it did not cure, it would do no harm. I was fully aware of the sensitive nature of Muscat foliage to the fumes of nicotine, but buoyed up by the belief that the coriaceous texture which it now possessed would make it immune, I was perfectly fearless of damage. That the fumes would attack the stout foliage of the Gros Colmans never entered into my calculations at all.

Two days afterwards, imagine my horror to find the leaves of the Colmans beginning to curl up round the margins. Next day the Muscats began to give unmistakable evidence also of disaster, and in about ten or twelve days, one would think that vinery was scorched with the sun or poisoned by sulphurous gas. I lost at least a fourth part of the foliage, and were it not that the Vines were in a vigorous condition, and that I allowed every particle of lateral growth to remain attached, I would not chance very much on the value of next year's crop.

The same means saved the growing crop, and with the exception of a little bad colouring in the Colmans, which, perhaps, was due to a wet season as much as to the little disaster, there was not much to complain of, after all. Still there was a decided disturbance of the natural health of the plants, and though not very apparent, may, however, show itself in some form next year. However, I am sincerely thankful that it was not worse, as it might have been. In its proper sphere XL All is a very valuable gardener's friend, however. The spiders in the above instance did not appear to have been the least inconvenienced.—HORTI.

P.S.—XL All must be used with caution in the early Peach house.

### The Uncut R.H.S. "Journal."

Kindly allow still another "Scottish Fellow" to add his grumble anent the uncut edges of the splendid "Journal" of the R.H.S. With every word in favour of the cut edges said by your other correspondents I emphatically concur, even at the risk of being considered "a barbarian." There are many of us who have little spare time, and who take no delight in cutting the pages of a book, thus taking up the time which would be better devoted to reading the valuable fare provided within. I hope the powers that be, will take into consideration the suggestion made, and that they will supply those who wish the "Journal" with its pages cut with copies in that form. The concession would be a boon to many, and among them to—ANOTHER SCOTTISH FELLOW.

I cannot resist supporting the plea of "Chelsonian," page 510, regarding the uncut pages of the "R.H.S. Journal." The contents are for the greater part most valuable, and are intended for the perusal and edification of the Fellows of the Society. There are many, I am aware, who would welcome its arrival with infinitely more pleasure if they could open its pages at once and dive into it; but are obliged, through lack of time, to delay it on account of the pages being uncut. The "Journal" is then often cast on one side until a convenient time, which very often means weeks, or not at all. One can scarcely see that it would add but little to the expense if it was done before it left the printer's hands. It would be a boon to many besides—A SOUTHERN FELLOW.

I am glad to see the references to the trouble of having to cut the multitudinous pages of the "Journal of the Royal Horticultural Society." To a busy reviewer this is a perfect nuisance, and I have no doubt that it prevents many notices of articles that would be given if the publication could be glanced through without spending a valuable half-hour in cutting it. For my own part, I cut the Journal only where some heading attracts me, and probably the great majority of the readers do the same.

To send out such a periodical uncut is to be much behind the times. I receive a good many similar publications from the several agricultural societies, but the "Journal of the R.H.S." is the only one not machine cut.—R.

### Gardeners and Situations.

It is distressing to learn that when it is made widely known by advertisement or otherwise that a situation of any value to be filled by a gardener is vacant, the applications for it are counted by scores, and sometimes by hundreds. That fact shows that, like many other vocations, gardening has its labour troubles, and finds the supply to so greatly exceed the demand. We do not hear of any suggestion that garden places are becoming gradually fewer. That some old places have been gradually broken up, and are now attractive suburbs or building sites there can be no doubt; but even in such cases myriads of small garden situations have been created that were readily filled. They are not high class places, such as need a first-class head, but they furnish occupation for very many men whose gardening knowledge if limited, at least suffices to enable them to work these small places very nicely, and in a way that gives general satisfaction. But it is in relation to the more pretentious gardens—the prizes of the profession—that the excess of supply is so gravely felt. It has been said that this dearth of situations is partly due to the fact that those in possession stick to them. That is a good reason, seeing that if those in possession left places more frequently they would still be items in the number which make up the great body out of work, or, at least, out-of-place gardeners. Gardeners in possession of places, if they be worth anything, do hold on to them; but this is more because that the holders realise the difficulty which besets the vocation in getting other places. They are, therefore, wise to make the best of even a bad position, if getting out of it may but lead to worse things. That there are places which, to good gardeners, are veritable purgatories, is but too certain. Where they are often being vacated it needs but little knowledge to understand their character. These are places good men should endeavour to avoid.

One of the changes now proceeding by which gardening is materially affected is found in the displacement of the old English gentry and nobility, whose ancestors have been patrons of gardening, and have always treated gardeners with high consideration, by a new race of owners or occupants, men whose wealth has been made in commerce, in mines, in all kinds of trading enterprises, and who now deem to settle down and play the part of English country gentlemen. Many of these have brought wealth into the old gardens they have become the occupants or possessors of. When to this has been allied good gardening tastes (and happily it is often so), their money has been spent freely; new gardens are made, new glass houses and other buildings erected, sometimes, indeed, of a truly palatial nature. It is in such cases as these gardening has had an impetus given to it which was badly needed. If many of our old families have grown rich, many more have become too poor to continue to occupy their old ancestral mansions and gardens; and the wealthy traders in taking their places have spent liberally, where the others had severely to retrench.

Probably it will be found that the incursion of the wealthy commercial element into country life, and especially garden life, has been good for horticulture. There can be no doubt that whether the places be good or bad very many have been found for first-class gardeners that otherwise must have been vacant, or become the charges of head labourers only. But even if there be an increase in the number of gardeners' situations or not (and that is so far as relates to good places very problematical), at least it is certain that there is no cessation in the manufacture of gardeners. Year after year young men go into gardening in so many diverse ways: in nurseries, in market-growing establishments, in botanic gardens, and colleges, and even the vocation is being very determinedly invaded by women, who exhibit a degree of energy, perseverance, and earnestness in their efforts to learn, that may well give pause to the young men, their competitors.

But the great manufactories of gardeners are, after all, the private gardens of the kingdom. In each of these, with a head who has held tenure perhaps some twenty or thirty years, there is passing through the gardens, as being trained, perhaps in the period stated some fifty to sixty youths, all of whom look forward to the day when they too shall become heads. Such hopes never can be fully realised, unless those who hold them are content to take, later on, single-handed situations, or where just one or two labourers are kent. There is just now in the kingdom, no doubt, for every head gardener five or six young gardeners, and heads go on increasing the numbers in the vocation without any consideration as to the future prospects of those they thus profess to introduce into the great fraternity of gardeners. When to this abounding superfluity is added the fact that at the present moment too, there are hundreds of first-class gardeners seeking vainly for situations, the grave position of the gardener is accentuated. We have a great need for a reduction of the exist-

ing supply of gardeners, especially of young ones, and head gardeners should, in justice to the youths they engage and train, seek to reduce the redundancy, keeping the best and sending the worst into other vocations. The matter demands grave thought and consideration, to be followed by remedial action.—SURREY.

### Commercial Travellers.

"A. N. Noyed's" remarks were presumably made for the sole purpose of opening a controversy—he never could have expected anything but a dressing down! He must have an extremely easy situation to be able to spend his valuable time in adopting a stratagem to defeat the ends and aims of "Mr. Nuisance." Surely it should have been an absurdly easy task to do better than "work dodges" with one so utterly devoid of tact and courtesy as was poor "Mr. Nuisance." I cannot but think that such a representative, however, exists only in "A. N. Noyed's" imagination. Certainly no firm of ordinary prescience would place such a man on the road in the first place!

If it did, however, in some error of judgment common to all, he would be quickly taken off again, for it is obvious that tact on the part of a traveller is the first essential factor to that gentleman's ultimate success, and therefore the sooner he is kept at home the more work is likely to be got through diurnally by such gardeners as "A. N. Noyed," as the temptation to play human draughts would be removed, for there would be no one to play the counter move.

I venture to think that commercial travellers generally are able to pay more respect to the personality of gardeners as a whole than "A. N. Noyed" is disposed to grant to a solitary individual, who (for the sake of argument we will say) presumes on the title of "Commercial Traveller." Primarily, courtesy; secondly, the courage to say "No" to a canvasser for orders, are the two graces that single out the professional gardener as a rule from such examples as "A. N. Noyed." May gardeners who are gentlemen, and travellers who can treat them as such, continually flourish!—CRATE EGG.

### Chrysanthemum Critique Controverted.

In the interest of some of your less experienced readers, I beg leave to point out that your correspondent, "Sadoc" (page 532), is mistaken in describing Mrs. T. W. Pockett as a sport from Nellie Pockett. I must also contradict some other of his assertions. Lily Mountford has not lost its rose colour; and if J. R. Upton has lost its rich yellow, what colour is it now? Mrs. Barkley is not a failure; neither is Florence Molyneux when properly grown. W. R. Church has been shown in splendid form this season, so that any lack of development must be purely a matter of culture. Mrs. J. Lewis, M. Louis Remy, and Le Grand Dragon have all been shown in good form this year; and, given a better season, there is no reason why they may not be as good as ever. If Mildred Ware is "medium sized," and Godfrey's Pride "too small," where are we getting to? And if Madame R. Cadbury is "a thing of the past," it is not a very far distant past, as may be seen by the accounts of recent shows. T. Carrington and Australie are still among the largest, and the "Heroine from the Isle of Man" is quite out of the hairy section, though it might take the place of Duchess of Sutherland as a Japanese incurved.—R. BARNES, Wych Road, Malvern.

I must take up the cudgels on behalf of some of the so-called unsuccessful varieties mentioned by "Sadoc" on page 532. First of all he says W. R. Church has not been consistent this season. Perhaps not, but it was mentioned twenty-one times in reports in the "J. of H." of 19th ult., and thirteen times in the issue of November 12. I always understood that the green tinge on the tips of the petals constituted one of the chief charms of this variety. In the analysis of last year it headed the list with M. L. Remy, another of the unsuccessful ones, and Mrs. G. Mileham. Then came F. Molyneux, Mrs. Barkley, Australie, Madame Carnot, and Mrs. W. Mease, all unsuccessful ones.

I have seen M. Chenon de Léché shown well this season, and see it won the award for premier bloom at West Hartlepool and received twenty-three out of twenty-seven votes at the last audit. J. R. Upton I find mentioned seven times in reports of 19th ult., and Guy Hamilton and L. Mountford have each won certificates for premier bloom.

Mrs. J. Lewis is far from played out yet, and given proper treatment is still one of the very best whites, and was marvelously well shown at Cardiff, and I venture to prophesy that when the result of the poll is declared many of "Sadoc's" so-called failures and varieties of the past will be in the first fifty, and some of them nearer the top than the bottom.

I cannot find Mrs. Clayton catalogued, but J. E. Clayton is a sport from Eva Knowles, and Mrs. T. W. Pockett is not a sport from Nellie Pockett, neither can it by any stretch of imagination be classed an "incurved Japanese."—A. H.

\* \* Numbers of letters have unavoidably had to be held over.—ED.

### Profitable Varieties of Bush Apples.

(Concluded from page 540.)

A good intermediate variety, in season from October to December, is Warner's King. It was known in the eighteenth century as King Apple, but was discovered, as it were, and brought into public notice by the late Mr. Rivers, of Sawbridge-worth, who got it from a Leeds nurseryman named Warner, and called it after him. It is a strong, erect grower, and should be given more space than most of the others mentioned. It is a very large Apple—"Fine for Apple dumplings," as someone said who saw it at a show—and is produced very freely. I have seen a specimen weighing 1½ lb. A friend of mine had a good crop last autumn on a standard tree, where Apples do not generally grow as large as on bushes, and five Apples together weighed 4½ lbs. It is at its best in October and November.

Everyone reading this series will miss some Apples that are put in every collection. Those I have mentioned, as stated before, possess four characteristics—they are hardy, healthy growers, good bearers, and of very good quality. They will thrive on almost any soil that is fit to grow fruit at all. Some favourite Apples have been omitted because they canker on wet soils, or are not sufficiently prolific at an early stage, or because I consider them overrated.

If one has a fairly warm soil—that is, fairly light and open and well drained, and not inclined to run together—there are several others which not only should not be omitted, but should be grown in preference to many of the preceding. The first, of course, is

#### COX'S ORANGE PIPPIN.

too well known to need description. It is universally acknowledged to be the best dessert Apple. It makes a very prolific bush, but is rather subject to woolly aphis and other forms of "blight" unless the soil is very suitable. This Apple is being planted in enormous quantities, and people ask if it will not become as cheap as other Apples when these trees come into full bearing. There seems no likelihood of this, as I am told we export large quantities of our best samples to the United States, as they cannot grow it there of such fine flavour as we can here. This Apple is another example of an Apple suddenly coming into notoriety, as it was raised as long ago as 1830 by a Mr. Cox, a retired brewer, of Slough, and only during the last ten or twenty years has it become really well known, even amongst gardeners.

#### KING OF THE PIPPINS.

This is another almost equally famous Apple, though not nearly so good, universally known as King of the Pippins. It needs a warm soil in a favourable district to be really first-rate, but in the opinion of most connoisseurs it is overrated at its best, though certainly a very good Apple. It is prolific, beginning to bear at an early age. Dr. Hogg says that the true King of the Pippins is ripe in August and September, and that the Golden Winter Pearmain is perfectly hardy and will grow in almost any situation. There appear to be at least two varieties of this Apple, one being spreading in growth and not very highly coloured, and another upright in growth and very highly coloured. Certainly Dr. Hogg's remark is not true of the latter, which in some places is scarcely worth eating.

#### MANNINGTON'S PEARMAN.

A dessert Apple of much better quality than the preceding, though we do not hear nearly so much about it, is the delicious Mannington's Pearmain. A well-drained soil and a fairly favourable position otherwise, are absolutely necessary for this Apple. It is worth any extra trouble if by that means it can be got to do well. It is strange that such an excellent Apple should have originated in a hedge where the refuse from a cider press used to be thrown. It is at its best in January and February, though it will keep till April. The flavour is remarkably sweet and rich, and to have it in perfection it should be allowed to hang on the tree as late as possible. Hence the advantage of the bush form for this and other late Apples. The tree is dwarf, and the growth slender and spreading. It is one of the most prolific varieties in good situations, young trees two or three years from the graft, bearing well.

#### WELLINGTON.

The last Apple to be mentioned is Wellington, alias Dumelow's Seedling, alias Normanton Wonder. It was raised by a Mr. Dumeller in a Leicestershire village, and introduced between 1815 and 1820, when the Iron Duke was at the height of his

fame. It is a medium sized Apple, from a bush, sometimes large. It is in season from October to April, in which latter month it is not bad eating, though always acid. In a tart it is a perfect sweetmeat. It is said to be the cook's favourite. In a cold, wet soil there is no Apple more liable to canker, and it is said to be more liable on the Paradise than on the Crab. It is very prolific.

Even now there are omissions which will surprise most people. It is amazing what differences there are in the lists of what the authors consider the best Apples. Some time ago Messrs. Pearson, of Lowdham, Notts, conducted an Apple election, consulting thirty-two Apple-growing experts all over the country, one of the points to be decided being the best six dessert Apples for bushes, combining quality with free bearing. Twenty included Worcester Pearmain amongst their lists of six. Further than this, Thompson's "Gardener's Assistant" mentions this Apple as one of three to grow, if only three can be grown, doubtless in order to have an autumn Apple. On the other hand, Dr. Hogg, usually very optimistic, merely says it is "A handsome early kitchen or dessert Apple, and, from its great beauty, a favourite"; while one nurseryman's catalogue simply puts it in the list of select kitchen Apples. Thus it is impossible to make a list which shall satisfy everyone. I have kept to the conditions mentioned at the beginning of this review, and do not pretend that if judged for quality alone, I should have mentioned all of the above-named. But some of those of the finest quality sometimes have to give place when we demand in addition hardiness, fertility, and healthiness and freedom of growth. A. PETTS, Essex.

### Young Pine Stock.

Spare no effort to keep growing plants from becoming drawn and weakly, by giving all the light possible, and not pinching them for room. Maintain a temperature at night of 55deg to 60deg, which, with 65deg in the daytime, will keep the young stock gently growing, admitting a little air at the top of the house at 65deg, leaving it on all day, but do not let the temperature fall below that point, and where the temperature advances to 75deg from sun heat a free circulation of air must be allowed. The bottom heat should be kept steady at 80deg. Avoid a damp atmosphere; an occasional damping of the paths will suffice. Water only when the plants become dry, then afford a proper supply of weak liquid manure.

Where a supply is required in May and June, and the plants are not showing fruit, it will be desirable to select from those started last March, which have completed growth and are now in a state of rest, such as show a stout base—the best indication of starting into fruit when subjected to a higher temperature both at the roots and in the atmosphere. The plants are best placed in a structure to themselves. Where this cannot be afforded they must have a light position in the house where the fruiterers are swelling. Maintain a night temperature of 65deg in the fruiting department, 5deg less in the morning of cold nights, and 70deg to 75deg by day, but in very severe weather a few degrees lower is preferable to extra sharp firing.—PRACTICE.

### Early Muscat Grapes.

Where Muscat of Alexandria Grapes are required ripe at the end of May or early in June the house must now be started. The Vines must have the roots wholly inside, and the soil be brought into a fairly moist, but not wet condition. The temperature should range from 55deg to 60deg at night, 65deg to 70deg by day, the lower heat representing the severe, and the higher the mild weather rate. These temperatures should be maintained until the buds break, when the heat will need to be gradually raised so as to have it 65deg to 70deg at night by the time the Vines come into leaf, 70deg to 75deg by day in dull weather, and 10deg to 15deg rise from sun heat; the house, therefore, must be well heated, and means provided for admitting air without causing cold currents. With these contrivances and good management success is assured, Muscat of Alexandria Grapes always commanding top prices, especially early in the season, but unless they are well done the Grapes are not satisfactory additions, considering that the expense is much greater, taking the cropping as compared with Black Hamburg into consideration. Madresfield Court is an excellent companion in black to Muscat of Alexandria, and forces splendidly.—VITIS.

### Pear, Beurré Bosc.

This week we figure a fruiting branchlet of this Pear, the fruits, of course, much reduced from the actual size. The "Fruit Manual" says, "This, which is generally supposed to have been a seedling of Van Mons, was found a wildling at Apremont, in the Haute Soane, and was dedicated to M. Bosc, the eminent director of the Jardin des Plantes at Paris." The French word, "beurré," signifies in English, "buttery." From some of the nurserymen's catalogues we extract remarks as follows:—

*Beurré Bosc*.—Large, prolific, requires warm situation. Medium. Richard Smith and Co.

Large, requires a warm soil and situation, a great bearer, does

well on chalky soil near the seaside. October and November. Cannell.

Large, a delicious half-melting Pear. Requires a warm soil and situation, otherwise it will not ripen. Not to be confounded with the Calebasse Bosc, which is a good market-garden Pear of second-rate quality. (D. G.) Rivers.

A large, shapely, yellow Pear, covered with cinnamon russet, in warm soils buttery and richly flavoured, in cool soils crisp and juicy; a heavy cropper and healthy grower. Clibrans.

Large, rich, and delicious; the tree is a great bearer, and generally succeeds best against a wall either trained as a dwarf or cordon; it forms a medium sized pyramid. October and November. J. Veitch and Sons.

Large, requires a wall or warm situation. Hundreds of bushels are marketed from orchards in East Kent, but unless the soil is warm and deep, it is not suitable for standards. A long russety fruit, which succeeds on chalk by the sea. Rich distinct flavour. (D. G.) Bunyard.

## Societies.

### Annual Meeting of the N.R.S.

A very large representation of rosarians from all parts of the country attended the annual general meeting of the National Rose Society at the Hotel Windsor, Westminster, on the afternoon of Thursday, the 15th inst. Mr. C. E. Shea presided, and there were present the following, whose names are given as they occurred in the signature book:—Messrs. Alfred Tate, B. E. Cant, C. Haywood, F. Page-Roberts, Alex. Dickson, H. V. Machin, R. Harkness, G. Burch, G. Moules, H. P. Landon, Geo. Bunyard, Geo. Paul, Cecil E. Cant, W. D. Prior, Lewis S. Pawle, W. H. Cooling, Capel Gifford, R. Basewell, Ed. Holland, Clifford Chadwick, F. Cliff, R. W. Bowyer, Dr. Shackleton, J. T. Strange, J. Stevens, Conway Jones, W. J. Jefferies, A. Foster-Melliar, G. Gordon, R. Powley, W. Boyes, J. Pemberton, O. G. Orpen, E. Mawley, Courtenay Page, H. E. Molyneux, A. R. Goodwin, G. Spight, T. Rigg, H. G. Mount, H. J. Spooner, J. Mattock, H. S. Bartleet, J. E. Rayer, F. Cant, A. Christy, G. W. Cook, E. Smith, E. T. Cook, J. Bateman, G. W. Piper, G. Caselton, J. Dennison, Dr. Masters, T. N. Flintoff, A. T. Pipon, A. Prince, T. B. Gabriel, W. Gallon, Mahlon Whittle, V. B. Johnstone, C. C. Williamson, and W. H. Birch.

After the preliminary business, the hon. secretary read the report, and the hon. treasurer the financial statement, as under:

#### REPORT OF THE COMMITTEE FOR THE YEAR 1903.

The report for the past year, which the committee have now the pleasure of presenting, must be regarded as, on the whole, a most encouraging one.

"The Rose season of 1903, like that of the previous year, proved extremely backward, and, as the date of the Metropolitan Show, July 1, was again unusually early, it appeared likely, only a week before the exhibition, that there would be few Roses out in any part of the country in time for it. Fortunately, with a change to warmer weather, the prospects became more favourable, and the tents were, after all, fairly well filled. As, however, might have been expected under such unfavourable conditions, the general quality of the flowers and the number exhibited fell short of what one naturally expects to see at this, the leading Rose show of the year. The number of exhibition Roses staged was even smaller than last year—indeed, smaller than any year since 1893, or for ten years.

"The committee gratefully acknowledge their indebtedness to the Treasurer and Benchers of the Inner Temple for again allowing the show to be held in their garden. They also tender their best thanks to the President and Council of the Royal Horticultural Society for so considerably placing their staff of assistants at the society's disposal on the show day. Both of these concessions are warmly appreciated by all in any way responsible for the success of the society's Metropolitan exhibition.

"As to the future prospects of that show, the committee feel convinced that when once this grand display of Roses comes to be regarded as an established annual institution, it will be much more largely patronised by the general public than at present. In a huge city like London three years is scarcely sufficient time to allow of an exhibition of this kind, held on only one day of the year, to become generally known. The committee have pleasure in recording that at the Temple Rose Show this year there was a gratifying increase in the number of classes for Roses staged in other ways than in the regulation boxes; indeed, only half the classes in the schedule were devoted to Roses staged in the latter way, whereas only five years ago the box classes claimed four-fifths of the schedule.

"The northern show, which took place at Glasgow on July 15, proved in all respects a magnificent one, and the resources of St. Andrew's Hall were taxed to the uttermost to provide room for the exhibits; 3,970 blooms of exhibition Roses were in all

Pear, Beurré Bosc. (Reduced).

staged, which is, with three exceptions, a greater number than at any previous northern exhibition held by the society. Every credit is due to the committee of the West of Scotland Rosarians' Society, and particularly to their new secretary, Mr. John Lindsay, for the arrangements made on that occasion. These were rendered unusually difficult owing to the extent of the show, and to its being held away from Helensburgh, the home of the society.

"Early in the year a subscription was set on foot in order to raise a fund in memory of that keen rosarian and generous friend of the society, the late Mr. Charles J. Grahame. Through the kind exertions of the Rev. G. E. Jeans and Captain Ramsay, secretary and treasurer of the fund, the sum of £52 11s. 6d. was collected. The first Grahame Memorial Prize was competed for at the society's Temple Show in July last. It is with much regret that the committee record the death during the past year of Mr. J. D. Pawle, a vice-president of the society and one of its earliest and warmest supporters.

#### "FINANCE.

"Considering that the takings at the Temple Rose Show were only about the same as in 1902, and that £62 had to be paid for the printing of the new edition of the official catalogue, which was issued to members last year, the present state of the society's finances must be regarded as highly satisfactory. The total receipts, including a balance of £14 19s. 3d. from the preceding year, amounted to £1,179 7s. 11d., and the expenditure to £1,126 0s. 11d., leaving a balance of £53 7s. in the treasurer's hands. Consequently there has been this year no occasion to make any call upon the guarantee fund. With a view to obtain the nucleus of a reserve fund, no provincial exhibition will be held by the society in 1904. Previous to 1901 there was no necessity for a reserve fund, but since the society began to hold an independent show in the Temple Garden the need of such a fund has been keenly felt. In the opinion of the committee this will be a much more satisfactory plan than relying from year to year on an annual guarantee fund. In the latter case any deficiency that may arise has to be made good by the guarantors alone, whereas with a reserve fund this would be defrayed, as it should be, out of the general funds of the society. There has again been during the year a very gratifying increase in the number of members. In 1900, the year before the Metropolitan Show was first held in the Temple Garden,

the number of members was only 584, whereas now there are over a thousand members on the society's books, showing a total increase in the three years of 72 per cent.

#### "ARRANGEMENTS FOR 1904.

"The Metropolitan Show will again take place, by the kind permission of the Benchers of the Inner Temple, in the Temple Garden, on Wednesday, July 6. There will be no provincial exhibition next year, but an autumn Rose show will be held in conjunction with the Royal Horticultural Society in the new Horticultural Hall of that society, on Tuesday, September 20. This is a new departure, and, should the season prove favourable, a most interesting and attractive exhibition of autumn-flowering Roses may be anticipated.

#### "MEMBERS' PRIVILEGES.

"Members subscribing one guinea will be entitled to six five-shilling tickets, and subscribers of half a guinea to three five-shilling tickets of admission to the society's exhibition in the Temple Garden. In addition to this, each member will receive an admission ticket for the society's autumn Rose show to be held in the new Horticultural Hall of the Royal Horticultural Society in Westminster. Members joining the society for the first time in 1904 will also receive copies of the following publications:—The new edition of the 'Official Catalogue of Exhibition and Garden Roses,' the new and revised edition of the 'Hints on Planting Roses,' the 'Report of the Conferencees on Pruning and Exhibiting Roses,' the 'Report on the Constitution of Rose Soils,' the 'Conference Report on the Decorative Use of Some Garden Roses,' and to a symposium on 'How to Grow and Show Tea Roses.' All members will receive, during the course of the coming year, a new treatise on pruning Roses, which will be prepared by a special committee of experts appointed for that purpose. Members alone are allowed to compete at the shows of the society. Members will be entitled to purchase tickets for their friends for the Temple Rose Show at reduced prices.

"The committee convey their best thanks to the donors of special prizes, the keen competition for which adds so much to the attractiveness of the society's Metropolitan exhibition, and especially to Captain Ramsay for the handsome cup he has now given for six consecutive years as the leading prize in one of the most popular classes in the show. The local secretaries have again done good service, the most successful being Mr. C. Barber, Mr. H. S. Bartlett, Mr. H. E. Molyneux, Rev. R. Powley, and Mr. J. Wakeley. For the largest number of fresh subscribers obtained by any one member during the past year the committee gratefully acknowledge their indebtedness to Miss Willmott, a vice-patroness of the society; in fact, during the last three years Miss Willmott has succeeded in adding to the list no fewer than fifty new and influential subscribers."

The foregoing report and balance-sheet having been briefly commented on by the chairman, were adopted unanimously. The thanks of the Society was given to the officers and committee for 1903, on formal proposition, and passed with acclamation. Bye-law 5 was then altered by unanimous consent as follows:—"That the first part read: Notice of any proposed alteration either of these bye-laws or of the regulations for exhibitions must be given in writing to the Secretary at least two weeks before a general meeting, and no bye-law nor regulation shall be altered except at a general meeting of the Society." This was simply to facilitate the business of the annual meeting, and also prevent any surprise being sprung upon it.

Next there was proposed an addition to Regulation 1: "That

Regulation 1 be altered so as to read:—That the Society shall hold one or more metropolitan shows in each year, and provincial shows when practicable. The date of the metropolitan show shall not be earlier than July 6."

This, of course, was proposed by the Rev. Jos. H. Pemberton, who has had to work hard and incessantly in order to get the alteration made. It was seconded by Mr. J. Jefferies, Cirencester, and after a prolonged discussion, in which Mr. Mawley moved an amendment, seconded by Mr. F. Cant, Mr. Pemberton won the day by about a dozen votes. Last year he only lost by one vote, and to make certain of victory on the present occasion he had urged as many supporters to his assistance as possible. The chief reasons for the proposals were circulated some months ago, and the bulk of them were printed in our pages at the time ("J. of H." September 10, page 249). The speakers in favour of the proposition were Rev. A. Foster-Melliar, M.A. (whose Roses, he said, were generally about their best on July 12), Geo. Gordon (who had prepared an analysis from the reports of N.R.S. shows for twenty years back, showing that the best exhibitions had all been on or about July 6 and 7), W. Boyes, Derby (who had never been able to show at N.R.S. exhibitions owing to the early date), Geo. Paul (who suggested that Roses bloom nowadays later than formerly owing to the use of the Briar stock instead of Manetti), also Alex. Dickson, J. Bateman, Highgate, N. (his Roses are at their best July 7 and 8), H. V. Machin, and a few other members from the Midlands.

On the opposing side there were O. G. Orpen, and a member from Croydon. Mr. H. Molyneux spoke, but did not take sides. One speaker remarked that the discussion seemed to divide itself into North v. South, to which there were repeated cries of "No! No!" A strong point with Mr. Pemberton was that as there would be no northern show this year, what was to become of northern members if an early date were decided upon? "The compulsory absence of the Northern and Midland growers, not only this year, but in several years past, seriously challenges our Society to the name of National."

While Mr. Pemberton fixed his dates between the 6th and the 12th, Mr. Mawley fixed his between the 3rd and the 9th. The latter said he was, however, truly in accord with the spirit of Mr. Pemberton's proposition, i.e., he wished the Society to be representatively National. July 6 would be right for a late, but not for an early, season. The two last seasons have been the latest on record during twenty-seven years, 1879 excepted. Mr. Frank Cant stood up for the "small" growers, men who have only a few hundred plants, who possess few maidens, and are therefore dependent on cut-backs, which are over, he said, by July 6. But as Mr. Foster-Melliar pointed out, the cut-backs must be cut still harder back, and they won't then be out of flower by the date named. The discussion was interesting in the main, and the matter may be regarded as settled for some time at least.

After the annual general meeting the friendly dinner was partaken of by most of those present, Mr. H. V. Machin, J.P., of Workop, presiding.

#### National Dahlia—Annual General Meeting.

The annual general meeting was held in London last week, when the following report was submitted:

#### REPORT OF THE COMMITTEE FOR THE YEAR 1903.

The past summer may, without exaggeration, be described as one of the worst Dahlia seasons on record. The severe frosts during the latter part of June completely destroyed the plants of many growers in the north and midlands, whilst the incessant heavy rains, often accompanied by destructive gales during August and September, together with the extremely low night temperatures of the latter month, made the season (and especially the show period), a most unusually trying one.

The London exhibition was held on September 1 and 2, and, despite the unfavourable season, the exhibits in point of numbers showed the satisfactory increase of 25 per cent., whilst the quality of the blooms was surprisingly good. Nine certificates were awarded to new varieties.

The Manchester exhibition held in conjunction with the Royal Botanical Gardens Society took place on September 11 and 12. The number of exhibits from the north and midlands was seriously curtailed owing to the disastrous effects of the June frosts, but in spite of this, a fairly large number of entries were obtained, and a satisfactory verdict must be passed on this: the first of the Society's provincial ventures. Five certificates were awarded to new varieties.

On September 15 a meeting of the committee was held at the Drill Hall, Westminster, on the occasion of the fortnightly show of the Royal Horticultural Society. Five certificates were awarded to new varieties. The number of certificates awarded to new varieties of all sections in 1902 was twenty-nine, and in the present year nineteen, out of a total of 105 seedlings exhibited.

On September 17, by permission of the Royal Horticultural Society, an inspection of the Caetus Dahlias grown for trial at

Chiswick was held by the committee. A prize of 10s. 6d., the gift of Mr. A. Dean, was awarded to Hobbies, Limited, for "Amos Perry," as the best variety for garden decoration.

The committee desire to convey their best thanks to the donors of special prizes, viz.: Her Grace the Duchess of Sutherland, the President, Messrs. J. Stredwick and Son, Messrs. J. Burrell and Co., Messrs. J. Cheal and Sons, Messrs. Dobbie and Co., Messrs. Keynes, Williams and Co., Mr. S. Mortimer, Mr. A. Dean, Mr. Robert Sydenham, Mr. J. F. Hudson, and Mr. T. Hobbs; also to the Horticultural Club for kindly allowing the Society's meetings to be held in their club room.

The terms offered by the Royal Horticultural Society in view of the opening of the New Hall being considered unsatisfactory, the committee decided to approach the Crystal Palace Company, with a proposal to hold the 1904 exhibition at Sydenham, and an arrangement to this effect has been concluded.

The committee have satisfaction in reporting a considerable increase in the membership of the Society for the year. The number of new members joining has been fifty-five, and the losses through resignations and deaths, nineteen, leaving a nett gain of thirty-six.

The committee, however, regret to observe the growing tendency of new members to avail themselves of the minimum subscription qualifying membership, and they consequently recommend that for the future members be divided into three classes, namely: "Fellows," paying annual subscription of one guinea; "Subscribers" paying annual subscription of half a guinea; and "Members," paying annual subscription of five shillings.

In order to facilitate the allotment of space for the different classes at the Society's exhibitions, and to add to the symmetry and general appearance of the exhibits, a scale of measurements for show-stands and boards has been drawn up. The committee particularly request that members will strictly adhere to these regulations.

The income of the Society from all sources, including the balance of £4 16s. 8d., in the Society's favour from the year 1902, amounted to £228 14s. 2d., and the entire expenditure, including the payment of all prizes awarded at the London and Manchester exhibitions, amounted to £211 4s. 9d., leaving a balance in the treasurer's hands of £17 9s. 5d.

### Royal Horticultural, Drill Hall, December 15th.

The last show of the year came as a surprise to most of the visitors, for the hall was completely filled. The chief honours, must, however, be given to the Orchids, which constituted a record for a December show. The collections of Cypripediums were superb. The fruit and vegetable section was the weakest. The collection of deciduous shrub-sprays staged by Mr. E. Beckett was worthy of all praise, and the collection of Evergreens and Alpines attracted much attention.

#### Orchid Committee.

Present: Harry J. Veitch, Esq. (in the chair); with Messrs. Jas. O'Brien, de B. Crawshay, R. Brooman-White, H. M. Pollett, H. Ballantine, Jas. Douglas, F. Wellesley, J. Coleman, N. H. Bilney, H. J. Pitt, J. Charlesworth, A. McBean, E. Hill, T. W. Bond, W. Gleeson, J. W. Odell, W. Boxall, J. W. Potter, H. Little, W. H. Young, W. H. White, and H. A. Tracy.

Baron Schröder, The Dell, Egham (Mr. H. Ballantine, gr.), sent some grand plants of Cypripediums, together with a few Oncidiums. The chief were C. Mrs. Chas. Canham, a grand piece with over fifty flowers; C. Leeannum var. giganteum, with ten good flowers; C. insigne var. Sanderæ; C. i. Harefield Hall var.; C. Pitcherianum Williams' var., carrying sixteen flowers; and C. L. var. Marsellianum, a beautiful plant; Oncidium ornithorhynchum album, and Lycaste Ballæ were also good.

A beautiful collection was that from Mr. J. Coleman (W. P. Bound, gr.), Gatton Park, Reigate, whose groups consisted chiefly of Calanthes and Cypripediums arranged with Ferns and Asparagus Sprengeri. The Calanthes included C. William Murray, C. vestita rubro-oculata, C. Bryan, in fine condition. The Cypripediums included nice plants of C. Leeannum giganteum and others.

Mr. G. F. Moore (W. Page, gr.), Chardwar, Bourton-on-Water, Gloucestershire, furnished a veritable sea of Cypripediums in a cut state, arranged in vases, and bedded in Maidenhair Ferns. There must have been hundreds of blooms. The chief forms were C. Euryades, C. insigne var. Cobbiana, C. Leeannum var. Fowlerianum, C. i. Bronze King, C. i. var. montanum magnificum, C. L. var. Clinkerberryannum, C. i. var. Sanderæ, and C. Arthurianum.

From Mr. H. Whateley, Kenilworth, came a small collection of choice Cypripediums, a few Odontoglossums, and a plant or two of Zygopetalum.

Messrs. Hugh Low and Co., Bush Hill Park, made a nice display, chiefly of Cypripediums, Oncidiums, and Odontoglossums. The best of the Cypripediums C. insigne Dormani, a fine spotted variety; C. Madame Jules Hye, C. i. Laura Kimball, C. i. Mrs. F. W. Moore, and C. i. Harefield Hall var.

Messrs. Cypher, of Cheltenham, staged a small but choice display of Cypripediums, in which were noted C. insigne Dorothy,

C. Maudie, a beautiful form; C. Venus punctata, and C. Leeannum aureum giganteum.

A few grand specimens came from M. Chas. Vynsteke, Loochriste, Ghent, Belgium. These included a grand plant of Odontoglossum Harryo-crispum Ridens, a magnificent form; O. Ardentissimum radicans, and Miltonia vexillaria robusta var. autumnalis.

Mr. E. Rodgers, gr. to O. O. Wrigley, Esq., Bridge Hall, Bury, Lancs., contributed a display of Cypripediums cut and arranged in Maidenhair Ferns. They were truly a wonderful collection, but it was difficult to find the names.

A large and well arranged group of Cypripediums, chiefly insigne varieties, were exhibited by Mr. W. G. Budgett, Henbury, Bristol. The varieties were arranged in groups, and very effectively too, many of them carrying a quantity of flowers.

Messrs. Jas. Veitch and Sons, Ltd., Chelsea, staged a nice collection, in which the Lælio-cattleyas formed the chief feature. The best appeared to be L. Semiramis, L.-c. Bryan, L.-c. Epicasta, and C. Luminosa. A few nice Cattleyas and Cypripediums completed the display.

From Mr. N. C. Cookson (H. J. Chapman, gr.), Wylam-on-Tyne, came a grand collection of Odontoglossums and Cypripediums. In the former were noted O. crispum Cooksonianum, a beautifully spotted variety; O. Adrianæ, Cookson's var. The whole flower is covered with well defined dots. The Cypripediums included a fine plant of C. insigne Sanderæ, C. i. Sanderæ; Oakwood Seedling; C. Niobe, and a fine plant of C. Leeannum Clinkerberryman.

Messrs. B. S. Williams and Son, Upper Holloway, staged Lycaste Skinneri, Cypripediums such as C. Leeannum, C. Harrisonianum, Williams' var., C. Chloroneurum, and C. L.-c. superba.

#### Floral Committee.

Present: W. Marshall, Esq. (in the chair); with Messrs. H. B. May, C. T. Drury, G. Nicholson, W. G. Baker, Jas. Walker, R. Dean, A. Perry, J. F. McLeod, J. Jennings, W. Howe, G. Reuthe, C. R. Fielder, W. Bain, C. Dixon, C. Jeffries, H. J. Cutbush, C. E. Pearson, R. C. Notcutt, H. J. Jones, W. P. Thomson, E. H. Jenkins, C. E. Shea, Geo. Paul, and Harry Turner.

Messrs. W. Cutbush and Sons, Highgate, presented a large exhibit of Conifers, Hollies, and Ivies in great variety. A few of the most striking were Retinospora plumosa aurea, Cupressus Lawsoniana erecta viridis argentea variegata, C. L. lutea. The Hollies were of good colour and clean growth. Many of the Ivies were 7ft or 8ft high, arranged in trices, while the Euonymuses and Pernettyas left little to be desired.

Messrs. T. S. Ware, Ltd., Feltham, occupied a table running the length of the hall, composed of Alpine plants. The Saxifrages, Sempervivums, and Sedums were fine collections, and would doubtless be interesting to lovers of these modest plants. Other fine exhibits were Shortia galacifolia, in its best winter tints; Gentiana acaulis, Thymes in variety, hardy Ferns, and Sarracenia purpurea; also a few nice Hellebores.

Messrs. Thos. Rochford and Sons, Ltd., Turnford Hall Nurseries, Broxbourne, exhibited decorative Crotons in 5-inch pots, all beautifully coloured. The varieties were C. elegantissimus roseus, Golden Gem, and Turnfordensis, a very striking variety, with green and gold leaves, the latter very broad.

Messrs. Jas. Veitch and Sons, Ltd., Chelsea, again made a grand display with their winter-flowering Begonias, some fine plants of Winter Cheer, Ensign, Julius, and Agatha being on view; also some good plants of Gesnera exoniensis.

Messrs. W. Wells and Co., Ltd., Redhill, staged a nice collection of Chrysanthemums, which included large specimen blooms, though the majority were of the decorative type. Madame P. Radaelli, Mrs. Swinbourne, and Mary Inglis were the best of the large flowers. Miss Emily Fowler, Letrier, Mrs. Filkins, King of Plumes, and Weeks' Crimson were the best of the decorative.

Zonal Pelargoniums were again exhibited by Messrs. H. Cannel and Sons, Swanley. The blooms were arranged in specimen glasses, and a very bright display they made. They were large, and the colours as rich as one would expect to see them in July. The best varieties were Mrs. Simpson, Duke of Norfolk, Mr. Joseph A. Bell, Countess of Jersey, Duke of Connaught, and King Victor.

Messrs. W. Bull and Sons, Chelsea, were represented by a fine group of Palms in fifty species and varieties. A group of cut Chrysanthemums came from Mr. Hemming, The Gardens, Alexandra Palace. Many of the varieties were past their best. Mr. T. Allman, The Nurseries, Wilmington, Dartford, exhibited a good market Chrysanthemum named Allman's Yellow.

Mr. E. Beckett, The Gardens, Elstree, made, perhaps, the most novel exhibit in the hall. It was composed of cut deciduous trees and shrubs having coloured stems, or those of an ornamental character. Some of the most remarkable were Rhus Cotinus, Rhus typhina, Rosa rugosa, Collutea Pococki, Cornus sanguinea variegata, Salix incana, Enonymus europæus, well berried; Leycesteria formosa, and Hydrangea paniculata grandiflora.

**Fruit and Vegetable Committee.**

Present: G. Bunyard, Esq. (in the chair); with Messrs. J. Cheal, H. Esling, A. Dean, E. Beckett, H. J. Wright, J. Jaques, G. Keey, J. Willard, P. C. M. Veitch, G. Reynolds, F. Q. Lane, W. H. Divers, G. Wythes, G. Norman, A. H. Pearson, J. McIndoe, W. Poupert, and H. Somers Rivers.

The chief exhibit in this section came from Mr. C. Bayer (W. Taylor, gr.), Forest Hill, who staged a nice collection of fruit. The 25 bunches of Grapes which made the background were especially good, Black Alicante, Muscat of Alexandria, and Gros Colman being excellent. These were relieved by coloured Vine leaves and Smilax trails. A Pine and a collection of Apples completed the display.

Mr. E. Beckett, Aldenham House Gardens, Elstree, staged a fine exhibit of Onions. Mr. C. Dixon, gr. to the Earl of Ilchester, Holland House, sent a dish of Pear Glou Morceau in good condition, also a large dish of Beurré Rance. Mr. Chas. Ross, gr. to Col. A. Houblon, Welford Park, Newbury, staged a seedling Pear called R. D. Blackmore, but many of the fruits were past their best.

Mr. A. D. Hall, Harpenden, sent 6 dishes of salad Potatoes, which were undoubtedly curiosities. Mr. C. Bellis, gr. to Mrs. G. M. Faulkner, Fonthill Lodge, Forest Hill, sent a fine basket of Seville Oranges.

**Medal Awards.**

FLORAL COMMITTEE.—Gold to Messrs. T. S. Ware, Ltd., Feltham; Silver-gilt Floras to Messrs. J. Veitch & Sons, Chelsea, and Lord Aldenham; Silver-gilt Banksian to Messrs. Cutbush & Sons; Silver Flora to Messrs. H. Cannell & Sons, and Messrs. Bull & Sons, Chelsea; Silver Banksians to Messrs. T. Rochford and Sons, Ltd., and Messrs. W. Wells & Co.

FRUIT COMMITTEE.—Silver-gilt Knightian to Mr. C. Bayer, and Silver Banksian to Lord Aldenham.

ORCHID COMMITTEE.—Silver-gilt Floras to Mr. J. Colman, Baron Schröder, Mr. N. C. Cookson, and Mr. G. F. Moore; Silver Floras to J. Veitch & Sons, Mr. O. O. Wrigley, Hugh Low & Co., and Mr. W. E. Budgett; Silver Banksians to Mr. H. Whateley, B. S. Williams and Son, and J. Cypher & Son.

**Certificates and Awards of Merit.**

*Chrysanthemum, Allman's Yellow* (Thos. Allman).—A decorative market variety described in these pages last week. A.M.

*Croton Turnfordensis* (T. Rochford & Sons).—A grand variety with broad leaves, of a rich yellow, edged green. Stems yellow, habit good, will make a popular plant. A.M.

*Cypripedium insigne Sunderae, Oakwood Seedling* (N. C. Cookson).—A lighter yellow form than the type, with a few spots on the dorsal sepal. A.M.

*Cypripedium Leeannum Clinkerberryannum* (Baron Schröder and O. O. Wrigley).—A grand variety, having a broad dorsal sepal, white, spotted towards the centre, and green at the base. A.M.

*Odontoglossum crispum Mariae* (N. C. Cookson).—A beautiful form, the ground suffused with rose, while each petal is clearly marked with chocolate. A.M.

*Odontoglossum Harry-crispum Ridens* (M. Chas. Vuylsteke).—A flower of large size, heavily barred with chocolate, the lower half of the lip being pure white. A.M.

*Odontoglossum Vuylstekei Vivicans* (Baron Schröder).—A grand form, heavily blotched with brown, the lip edged white. F.C.C.

**Beckenham: Beautifying Waste Spaces.**

On Friday, December 4, Mr. Lovett, F.R.H.S., of Addiscombe, gave a lecture on "The Beautifying and Utilising of Waste Spaces, Railway Embankments, &c." This proved to be highly instructive and interesting, and certainly worthy of a far larger audience than assembled. Mr. Lovett is of opinion that in our country, where too frequently leaden skies prevail, colours more pleasing to the eye might be used than is generally the case. For instance, railway bridges painted the usual purple or reddish brown, would be more pleasing if of a yellowish or sage green, with Ivy planted at the bases of the arches. In the same way the lecturer brought his remarks to deal with unsightly objects in the garden landscape, &c. At the close a hearty vote of thanks was accorded Mr. Lovett and a like compliment to the chairman.—T. C.

**Cardiff: Seed-saving.**

The fifth meeting of the session took place at the Grand Hotel on Tuesday, December 1, Mr. H. R. Farmer in the chair. Mr. H. Kitley (seedsman to Messrs. Garaway and Co., and representative of the Bristol Gardeners' Association) delivered an excellent lecture on "Seed Testing and Saving," explaining to the minutest particulars the best means to adopt in testing seeds, and best forms of fruits and flowers to select seed from. The lecturer contended most emphatically that deterioration in constitution to a great extent was due to lack of attention in selecting seeds from the best sources. A good lesson was given on seed testing and best times to sow seed in this our changeable climate. The best thanks of the meeting were accorded Mr. Kitley for his excellent lecture.—J. JULIAN.

**Sheffield: Onion Culture.**

At the monthly meeting there was a good attendance of members to listen to an essay by Mr. T. J. Nelson, of Ashgate Gardens, Chesterfield, on "The Cultivation of the Onion," which proved to be an interesting one. Mr. Nelson is well known as a successful plant, flower, and vegetable grower, as well as an exhibitor, and has grown some large Onions, having produced some this season weighing 2½ lbs each. He described his method of treatment, and exhibited some very shapely and weighty specimens of Ailsa Craig, to which a certificate was awarded. An excellent exhibit of Onions was also shown by Mr. H. Deverill, of Banbury, some Aristocrats measuring 17 in in circumference. "Cocoa-nut" was very fine and weighty, as also was "Ailsa Craig." A red variety, "Challenge," attracted particular attention, being good in colour and shape, and very sound and solid: Certificates were awarded. "Northern Star" Potato was exhibited by the Secretary, and came in for much attention and criticism. The 1904 schedule has been arranged, and should attract exhibits. Prizes of £16, £10, and £6 are offered for a group; £5, £3, and £2 for 36 Roses, in addition to four other classes; £2, 25s., and 10s., for bouquets; 30s., 25s., 20s., and 15s., for tray of 6 vegetables; all being open. As the show will be held in the beautiful grounds of "Holly Court," on August 13, it is hoped the society will be placed well upon its legs.

**Ipswich: Judging.**

In consequence, no doubt, of the inclemency of the weather, there was but a small attendance of members at the meeting of the Ipswich Gardeners' Society, held on December 3. The president (Mr. R. C. Notcutt) occupied the chair, and the essayist was Mr. W. Messenger, Woolverstone Park Gardens, his subject being "The Judging of Horticultural Exhibits." All gardeners (said the essayist) were more or less interested in shows, and everyone concerned was anxious that the judging should be carried out in a satisfactory manner. In the first place, it was necessary that the schedules should be accurately worded. Great improvement had been effected in this direction in recent years, due in a large measure to the excellent code of rules issued by the R.H.S., a work that should be carefully studied by both exhibitors and judges. Exhibitors should be most careful to grasp the correct meaning of the wording of the schedule, as disqualification was a bitter pill to swallow. With regard to judges, Mr. Messenger said that in his experience it was the conscientious desire of every judge to award the prizes to what, in his opinion, were the best exhibits. To facilitate this, it was essential that their duties should be commenced punctually at the appointed time, and they should not be expected to undertake too much.

**POINT JUDGING**

should be resorted to in all large classes. In close competition he personally should like to see the number of points awarded displayed publicly. Many amusing anecdotes of the essayist's experience as an exhibitor and judge were interspersed, and added to the interest of a well-thought-out paper. A brisk discussion was initiated by Mr. J. Morgan, and sustained by Messrs. Cotton, Whittel, A. Creek, Barker, C. Creek, Kedgeley, Adcock, &c., the proceedings closing with a cordial vote of thanks to the reader of the paper.—E. C.

**Liverpool: Cut-flower Supply.**

The meetings of the above association are becoming more popular, and the attendance is all that could be hoped for. Especially are the younger members of the craft in this district attending well, and who came forward in large numbers on the 5th to hear Mr. Horne, Dawpool, Cheshire, give a discourse on "How to obtain a continuous supply of indoor cut flowers for home use, with cultural details." The subject being of such a wide and varied character, Mr. Horne could only touch slightly on the cultural points. A few of the principal subjects mentioned were as follows: Azaleas, Amaryllis, Begonias, bulbs in variety, forced in boxes; Celosias, Cyclamens, Chrysanthemums, Carnations, Eucharis, Forced Lilac, Gladioli, Lily of the Valley, Liliums, Orchids, Poinsettias, Rhododendrons, Richardias, Roses, and Spanish Irises. A very instructive discussion followed on how best to succeed in forcing Lily of the Valley, Mr. Horne advocating the use of good soil for this purpose, and systematic feeding with liquid cow manure. Several members disagreed on this point, preferring to plant the crowns in cocoanut-fibre, and have no feeding. Mr. Horne also succeeds well with Iris hispanica, forcing over one thousand plants annually, ninety per cent. of which produce good spikes. His method of procedure is to pot the bulbs on arrival and plunge out of doors in ashes until the pots are well filled with roots. About Christmas they are in this condition, and are then removed into a cold frame, and subsequently given a little heat. He attributes his success in a great measure to securing well-ripened bulbs and allowing them to progress slowly. He secures flowers in March and April. A point raised afterwards was the watering of plants, two members

advocating the use of the hose-pipe with discretion from April to October inclusive in lieu of the watering-can, their contention being that plant pests, i.e., fly, thrip, bug, &c., were kept under; clean and healthy growth the result, and a great gain in time and labour. A vote of thanks being passed to Mr. Horne, and Mr. Foster for presiding, a most instructive and pleasant evening terminated.—J. S.

### Metropolitan Public Gardens Association.

**OPEN SPACES.**—At the monthly meeting of the Metropolitan Public Gardens Association, 83, Lancaster Gate, W., the Hon. Dudley Fortescue, Vice-chairman, presiding, a request from the Grocers' Company that the Association should continue to maintain the garden in Princes Street on behalf of the Company, was received and agreed to. A letter was read asking for the assistance of the Association in the laying out of the Norfolk Square area, Islington, to the retention of which, as a public recreation ground for a very crowded district, the Local Government Board, on the representations of the Borough Council and the Association, had at length assented; and it was agreed to deal with the matter at the next meeting after certain requisite information had been obtained.

It was decided to protest against a proposal to extend Rosebery Avenue by way of Duncan Terrace to the Essex Road, which would have the effect of extinguishing one public garden laid out by the Association, as well as several green strips that it is hoped to eventually acquire as an addition thereto. Remonstrances were received against building operations upon the Duke of Westminster's garden in Duke Street, which for some years the Duke, at his own expense, had opened to the public, and in reply to its representations that the space should be spared, the Association was informed by the Duke's agent that the building was a transformer station, mainly underground, and that it would have a flat roof rather above the level of the roadway, enclosed with a stone balustrade, which would be tastefully laid out with shrubs, trees and seats for public use.

The St. Thomas's Hospital authorities wrote expressing regret that they could not see their way to abstain from building on the triangle in Lambeth Palace Road. Proposals for dealing with Golden Square, W.C., and Poplar Churchyard were considered.

It was stated that tree planting at Queen's Road, Battersea, and St. Thomas's Street, S.E., had been completed, and that similar work in Lamb's Conduit Street and elsewhere was in hand. It was agreed to ask the First Commissioner of Works to spare certain portions of the Duke of York's School site, containing fine trees adjacent to existing thoroughfares, and to plant double the number of trees in the processional route now being formed in the Mall than would eventually be needed.

The question of the preservation of London squares, with special reference to Edward Square and Pembroke Square, which, it was stated, had recently been sold by auction, was further considered. Progress was reported in regard to schemes for extending Hampstead Heath, and for acquiring an estate at Upper Clapton, and communications were received from the Director of Kew Gardens, asking that the Association should make efforts to preserve Lots Eyot, an island opposite the Gardens, which is threatened with building operations.

### Chester Paxton—Annual Meeting.

Mr. N. F. Barnes, Eaton Gardens, presided over the annual general meeting which was held at the Grosvenor Museum on Saturday. The hon. secretary, Mr. G. P. Miln, in presenting the annual report and balance-sheet pointed out that the exhibition of fruits and Chrysanthemums held in November was the best in the history of the Society. A number of new members and subscribers had been added to the list, this now standing at over 500. The Society's finances had also been augmented, there now being a surplus in hand of over £65. On the proposition of Mr. Robt. Wakefield, the report and accounts were adopted, and a hearty vote of thanks accorded to Mr. Miln for his valuable services. Major MacGillivuddy was re-elected hon. president, and Mr. N. F. Barnes chairman of committee. Mr. R. Newstead, A.L.S., was also re-elected consulting naturalist. A unanimous wish was expressed that Mr. Miln should again undertake the duties of secretary and treasurer, to which he consented, and the following were elected to serve on the committee for the ensuing year:—Messrs. A. W. Armstrong, John Breen, J. Claek, John Dutton, A. Ellams, C. Flack, T. Gilbert, John Jackson, H. G. Little, G. Lyon, S. May, C. Nixon, H. Pierce, Wm. Pringle, Josh. Ryder, J. D. Siddall, E. Stubbs, Robt. Wakefield, John Weaver, and John Wynne. It was resolved that the next exhibition of fruits and Chrysanthemums be held on November 16 and 17, 1904.

[We regret that pressure on space has necessitated the holding over of reports from Bristol and Sheffield.]

## Young Gardeners' Domain.

### Begonia, Gloire de Lorraine.

Being a constant reader of your valuable *Journal*, and seeing space allotted for young gardeners, I would like to pen a few lines on the culture of that beautiful Begonia, *Gloire de Lorraine*. I prefer to take cuttings at the end of March, as the best cuttings are from suckers. Put them singly into very small pots, and place them in a brisk, moist bottom heat. When rooted, add a little air to the propagating case, and in a few days place them on a shelf near the glass in a warm house, say 60deg Fah., at night, rising to 70deg Fah. in the daytime. When they have been there a few days, pot them into 60's, and grow them in the same temperature. This Begonia likes a warm, moist atmosphere, and should be shaded from direct sun. Pot the plants on, as required, and then place them again in the same temperature, and when they have nearly completed their growth, place them in a house of 50deg Fah. at night, rising to 60deg Fah. in the daytime, with a little air added to the top of the house; side draughts must be avoided. Care must be taken with the water-pot, as it is an easy matter to over-water and cause the plants to damp off. We have beautiful plants 28in high and 2ft across.—SECOND GARDENER.

### Chrysanthemum Cuttings.

The present is a good time for inserting cuttings of some of the later flowering varieties of Japanese Chrysanthemums, the last week of December being the most suitable time for inserting the bulk of the midseason varieties with, of course, a few exceptions. There are many different methods of striking, but the one I prefer is as follows: Place a required number of clean, well-fitting hand-lights on some pieces of slate, on a stage or floor of a light house, in which a temperature of about 50 deg Fah. is maintained, and over the slate bottom spread a layer of about 2in of moist, sifted ashes. Take your cuttings (root-cuttings, if possible) which should be about 2½in long, and prepare in the usual manner.

Prepare a number of large 60-sized pots, by nearly half-filling them with crocks, and then placing a layer of coarse leaf mould on top. Fill these with a soil consisting of two parts loam, one of leaves, and of sand, which should have been thoroughly mixed and passed through a ½in sieve, and press down fairly firm. Place five cuttings round the edge of each pot and give a soaking of water. Then place them in the handlights and keep the cuttings from flagging by frequent overhead sprinklings, removing the tops of the handlights each morning for an hour to let the excess of moisture escape, otherwise keeping close. All damped leaves and cuttings should be instantly removed, as they tend to affect others.

As the cuttings commence to root, a little air may be afforded them on favourable occasions, and this can be increased gradually, if the cuttings do not flag, until they are well-rooted, when the lights may be removed entirely. Below are given a few varieties which require a longer season of growth:—Mad. Paolo Radaelli, General Hutton, Mafeking Hero, Calvat's Sun, J. R. Upton, Mrs. E. Hummell, Dorothy Pywell, Australie, Mrs. H. Weeks, Mad. Herwege, Wilfred H. Godfrey, and Durban's Pride.—E. B., South Berks.

[The answer by "Scot" to the criticism on his article entitled "Principles of Propriety" arrived too late for insertion in the present issue.]

**PUBLICATIONS RECEIVED.**—"The British Canadian Review," a weekly chronicle of the growth of Canadian enterprise, Vol. XIII., No. 343. . . . "Garten Flora," Nov., with coloured plate of *Odontoglossum crispum Marienfeldiense*. . . . "Le Moniteur d'Horticulture," Dec. 10, with coloured plate of *Lælia* (syn. *Cattleya*, Lindl.), *crispa*, Reich. . . . "Orchid Review," December, with a beautiful half-tone illustration of *Habenaria earnea*. *Cypripedium* (or *Paphiopedilum*, as systematists now call it) *Godefroyæ* and its allies are here treated; also Orchids in the sub-alpine Cordilleras of South Mexico, Orchids in season, Calendar of Operations for December, and other articles. Price 6d.

"The Garden Diary." George Allen, London, 3s. 6d. This is a little book bound in stout covers, and having a page for every day in the year. The lower half of the page is left blank for notes, while the upper half contains a selected verse from the poets. For every month, too, there are cultural directions. The authoress is Rose Kingsley. \* \* \* "Monograph of the Coccidae of the British Isles." Vol. II., by Robert Newstead. London: Printed for the Ray Society. \* \* \* "The Heather," by Alex. Wallace, editor of the "Florists' Exchange," New York. \* \* \* "Some Lesser-known Japan Trees and Shrubs, and Some Recently Introduced Trees and Shrubs from Central China," by James H. ### Fruit Forcing.

**VINES: HOUSE TO AFFORD RIPE GRAPES IN MAY.**—The structure for this purpose should be started without delay. A bed of leaves and litter in a state of fermentation placed on the floor of the house, turning a portion of it daily so as to supply ammonia to the atmosphere saves fuel, and conduces to good break by constantly giving it moisture and warmth. Outside borders should have the needful protection from cold rains, snow, and frost; a few inches thickness of dry leaves and a little litter over them answer where the Vines are planted inside, but where the border is all outside a covering of warm litter is preferable, two-thirds of leaves and one-third of stable litter affording a less violent heat than manure alone, also more lasting, adding fresh material as necessary. The inside border must be made thoroughly moist by applying water, or, in the case of weakly Vines, liquid manure, not too strong and never less in temperature than the mean of the house. Avoid, however, making the soil very wet, for that hinders root formation and tends to a soft growth, often resulting in shanking. Start with a night temperature of 50deg in severe weather, 55deg in mild weather, and 65deg by day, except when the weather is cold, when 55deg will be more suitable. This slow work is better than a high forcing heat, which induces a weak growth, and we do not advise these temperatures to be exceeded until the growth commences. Depress young canes to the horizontal line, or lower, to ensure the regular breaking of the buds. Maintain a moist atmosphere by syringing occasionally, but avoid excessive moisture and keeping the roots dripping wet, which excites the production of aerial roots from the rods.

**LATE HOUSES.**—Vines that have the foliage all off will only require fire heat to exclude frost, but there must not be anything like a moist, stagnant atmosphere, or the Grapes will speedily damp and decay. Leaky roofs are a chief cause of Grapes keeping badly, and wide laps are not much better, as the wind drives the water from them all over the upper side of the berries, causing them to spot and rot. Grapes cannot be kept under such circumstances, and the sooner they are cut and bottled the better. A temperature of 40deg to 50deg suffices for the thick skinned Grapes. Muscats require a mean temperature of 50 deg. The air must be kept in motion by a gentle warmth in the pipes, and ventilation given whenever there is a chance of securing a change of air without danger of letting in more moisture than expelled.—**ST. ALBANS.**

### Kitchen Garden.

**BLANCHING ENDIVE.**—A few roots may be blanched at a time. To carry out the process outdoors, tie the points of the outer leaves together, thus enclosing the heart, and cover with inverted pots, stopping the drainage hole with a piece of clay, or laying a slate over. If frosty weather is anticipated, a number of roots should be lifted, with plenty of soil adhering, and placed in a frame. Cover the plants to blanch, and also darken the frame with mats to assist the blanching and exclude frost. A dark room or cellar will also serve for blanching at this season.

**LETTUCES IN FRAMES.**—Attention must be given to affording free ventilation to plants in frames, and picking off all dead leaves. Dryness of the foliage is essential, for much moisture collecting at the base of the leaves will soon cause the hearts to rot.

**ONIONS.**—The stock of Onions in store ought occasionally to be looked over, as some bulbs are liable to decay. So long as Onions can be kept safe from frost they cannot be kept too cool. If thoroughly dry and firm a slight frost will not harm them. Damp air is an enemy, as it causes them to grow. An excellent method of keeping Onions is to string them in ropes.

**POTATOES FOR POT CULTURE.**—Medium sized sets of early varieties, such as Ringleader, Sharpe's Victor, or Royal Ashleaf, may be selected and stood in shallow boxes. Scatter some light leaf soil between, and place the boxes on a light shelf in a warm pit or greenhouse. Occasionally sprinkle with water to induce sprouting. When growths show, thin all out but the principal and strongest. As roots will also push into the soil, it is desirable before they become too much matted together to pot the tubers, placing one in the centre of a 10-inch pot which has been moderately drained and half filled with a mixture of leaf soil, loam, and rotted manure. Keep the pots in warmth at first, and give but little water. Top dress when the growths are high enough, and to ensure a stocky growth choose a very

light position with less heat, but plenty of air on favourable occasions.

**FORCING SEAKALE.**—A batch of Seakale roots which have been prepared for forcing should now be introduced into a warm structure. A good mushroom house or warm cellar is, of course, the best place. A space should be enclosed for holding soil of a depth sufficient to bury the roots to the crowns. If a bed of soil is not convenient, employ deep boxes or pots. Light is easily excluded from these by inverting other pots or boxes over. A temperature of 55deg will suffice. Hard forcing is not productive of good results, the growth being weak and stringy. Keep the soil moist. Fresh batches may be introduced weekly or fortnightly, according to the demand.

**RHUBARB.**—Place an additional lot of roots in the forcing house or warm structure, these being intended to follow the earliest supply. Rhubarb will do well either in a light or a dark place, providing the roots are kept moist by the natural humidity of the atmosphere, or surrounded with soil, which should be watered occasionally. Usually the best results follow a certain amount of blanching; therefore, if a dark structure is not available, cover the crowns with boxes or tubs.

**FORCING ASPARAGUS.**—This vegetable is best forced on a well prepared hotbed, employing roots three or four years old. The hotbed should be a mixture of leaves and manure, and built in the open, so that a frame may be placed on the top, and linings of manure added on the sides to keep up the temperature as necessary. Cover the manure with several inches of soil, and on this place the roots thickly together. Fill in between and over them with light compost, consisting of loam, mushroom bed manure, and leaf soil, covering them to the depth of four inches. Give a good watering with tepid water. Admit air when necessary to regulate the temperature, which may range between 60deg and 70deg. In cold and frosty weather cover the glass with mats.—**EAST KENT.**

## Weather Notes.

### In the North.

The first half of December has brought samples of all sorts of weather—rain, snow, frost and thaw following each other in short and uncertain succession. Some of the days, from fog and cloud, have been very short; the nights dark and unpleasant. During the fortnight frost of from 2deg. to 15deg. has been registered, mainly in the former week. A period of dull and drizzly weather has again set in from the 10th to the 14th.—**B. D., S. Perthshire.**

### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

The weather has been dull, and at times very dark, with rain on six days, bringing the total rainfall for the year to date to 36.45 in.

### The Potato Boom.

Professor W. J. Malden, in the "Spalding Free Press," gives vouchers of sales at the rate of 5lb. and 10lb. of Eldorados at £40 per lb. He anticipated that at Smithfield Show no Eldorados would be sold under £50 per lb., or at the rate of £17 per Potato. The actual sales tripled his forecast. The Professor points out that at £3 per lb., or £300 per cwt., the result will be, after two years, in spite of what seems such an alarming primary outlay, the Potatoes will not have cost 4d. per lb. The calculation works out thus:—As 1lb. of Potatoes easily produces 100lb., the produce of 1lb. at £3 per lb. is worth £300. To carry it a year forward, the 100lbs. will produce at least 100-fold, or 10,000lbs., or nearly 4½ tons; the outlay to produce these during the two years will not amount to £100, so that for £150 the 4½ tons are raised.

## TO CORRESPONDENTS

\*\* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

**RUST ON CHRYSANTHEMUM LEAVES** (Gardener).—Badly attacked by "Rust" (*Puccinia Chrysanthemi*). The only cure is to burn the plants. See reply in "J. of H.," page 478, November 19.

**GROWING MUSHROOMS IN BOXES** (Omega).—Yes, Mushrooms can be grown in boxes without bottom heat in a glass house the temperature of which will not be allowed to fall below 40deg. The boxes may be 3ft in length, 15in wide, and the same in depth. Mushrooms may also be grown in large pots, using chiefly horse droppings and dried cowdung, placing in a greenhouse or a deep cellar where frost does not come.

**ANGLE OF ELEVATION FOR VINERY** (Idem).—The best general angle of elevation is 40deg, especially in structures where little fire heat is employed, as it is important that the heat should be distributed as equally as possible throughout the whole of the interior of the house, for the sap naturally to flow in greatest force to the upper parts of plants, all circumstances being the same, but it is also attracted to where there is the greatest heat, and if this is at the top there is a double tendency to that part; whilst, on the contrary, the lower portion suffers no undue diminution in proportion. Now the higher the pitch of the roof the greater the accumulation of heat at the upper angle, so that we may say the lower the pitch the less the difference between the temperature of the air at the top and bottom of the slope. Owing to this it becomes desirable to keep the slope as low as is consistent with the admission of abundance of light. An angle of 40deg is also suitable for a Peach house.

**MOVING YEW TREES** (H. S.).—The Yew is a very tractable subject, and may be moved with facility, only care is taken to retain a considerable amount of ball, and consequently young roots in lifting, these being produced freely from the collar or large roots retained in lifting, the operation taking place in the spring when the Yew is on the point of starting into growth, and choosing showery weather for the operation. We have moved trees quite as old as those you mention, the heads being curtailed correspondingly with the loss of roots, the Yew breaking freely from the old branches and even bole when these parts only are left. In the case of a hedge of fifty to sixty years of age there may be considerable difficulty in taking up, the trees with sufficient roots and balls of soil to ensure success, as they will be very hard to separate in the line or between each tree, though what is lost in line may be gained sideways. As you are in the habit of moving large Conifers with success, we have no doubt you will also be able to remove the Yew successfully, or at least form a definite conclusion as to its practicability or otherwise from the foregoing remarks.

**MUSCAT OF ALEXANDRIA VINES NOT RIPENING THE WOOD** (Head Gardener, G. H.).—The wood of the lateral is quite green, large in pith, and somewhat long-jointed, and also not strong. It usually arises from the conditions of soil and of atmosphere being such as to favour sappiness of growth, the border being of a rich nature and not containing sufficient opening, or mineral substances, such as calcareous and siliceous matter, especially the latter. It sometimes results from too low a temperature and a deficient amount of space and ventilation. This, probably, is applicable to your case. Indeed, we should say that the soil has been kept too wet, the atmosphere too close, and the temperature too low. Under the circumstances we should keep the border as dry as consistent with the health of the foliage, and a temperature of 60deg to 65deg at night, with 10deg to 15deg or more advance from sun heat, admitting air freely, even some by night. But the season is so far advanced that little can be effected. If you give the border a dressing of the following mixture, it would probably assist the Vines in the coming year. Dissolved bones dry and crumbling, 3 parts; sulphate of potash, 2 parts; sulphate of magnesia, 1 part; sulphate of iron,  $\frac{1}{2}$  part; mixed; applying 4oz of the mixture per square yard, and pointing in very lightly, not interfering with the roots. Keep drier at the roots another season, afford every lateral or bearing shoot plenty of space for development and full exposure of its foliage to light, ventilating freely and securing a good heat, even in the early stages of growth.

**FLORIST AND POMOLOGIST** (Mrs. W. B.).—This is long since defunct.

**JUMPING BEANS** (S. Fielding).—We will reply by letter in a day or two. Meanwhile, many thanks for the short article.

**THE BANKSIAN ROSE FLOWERING** (Rev. W. H. J.).—In a topsy-turvy season, what conclusion can one come to? Certainly it is late, but Homère we have had flowering at Christmas. You are fortunate to get it to flower at all.

**SLIDES FOR LANTERNS** (X. Y.).—We do not know of anyone who systematically lends out lantern slides. You can get them made at various places. If you care to communicate with Mr. John Gregory of 62, Canterbury Road, Croydon, you will receive fuller information on this subject than we can furnish.

**VINE ROOTS DECAYED** (Gardener).—We will examine them and report more fully. The border and the roots, however, have evidently been grossly neglected. Follow hints given by "St. Albans" under "Work for the Week." Our correspondent repeatedly, and at length, urges inspection of roots and borders, and describes remedies.

**NAMES OF FRUITS**.—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (F. F.).—1, King of the Pippins; 2, Allington Pippin; 3, Cox's Orange Pippin; 4, Wellington.

**NAMES OF PLANTS**.—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (R. A. Clark).—Your specimens had been overlooked; they will be named in next issue. (J. T.).—*Schizostylis coccinea*. (N. O.).—1, *Adiantum trapeziforme*; 2, *A. concinnum*; 3, *A. macrophyllum*; 4, *A. Lindenii*. (J. B., Berks.).—1, *Ilex Aquifolium angustifolia*; 2, *I. ferox argentea*; 3, *I. flavesces*; 4, *latifolia*; 5, *I. laurifolia*; 6, *I. ferox aurea*. (N. N.).—1, *Fuchsia triphylla*; 2, *Cytisus filipes*.

## The Bee-keeper.

### The "Hexagonal" Stewarton Hive.

I am pleased to learn that my articles have been taken advantage of beneficially by "Hexagonal," and with regard to the merits and demerits of the Stewarton hive, I will endeavour to embrace all the points upon which he seeks information, and those which influenced my selection of the modern "W.B.C." for general utility in my own apiary.—E. E.

**QUERIES**.—"Will you kindly inform me through your columns which is the largest, the wasp or the hornet; also if a Queen wasp or bee have stings?"—X. Y. Z.

### Trade Catalogues Received.

James Veitch and Sons, Limited, Chelsea.—(1) *Vegetable and Flower Seeds, 1904*; (2) *New Chrysanthemums*; (3) *Border Carnations and Picotees*.

Sutton and Sons, Reading.—*Seeds*.

## "Something Wrong in the State of Denmark."

Such was the quotation (only that we have substituted "wrong" for "rotten") we found in a letter from a farmer friend the other day, a man who farms, and farms successfully, a wee bit of the best land that lies out of doors: a farm that has in years past been almost equal to a little gold mine. It has been in the hands of one family for nearly a century, and they have put good work and good money into it. And now this man writes a sad tale of woe. He has been hit hard; not knocked out of home altogether, for we don't think that would be done; but he pauses and wonders how he is going to balance accounts this year of grace, 1903.

He writes that the first step towards anything better for the agriculturists of England is a thorough revision of the land laws. There must be a better and easier method found of selling and buying land. There is no question as to this. A man who can afford to purchase a large estate is in a position to care very little for any conveyancing fees. It is the poor, struggling man

who wants a few acres freehold, that he may improve and pass on to his heirs. He is the man that suffers. To begin with, the small parcel of land he requires is always sold at a price far beyond its actual value. Yes, we know all about that: that price is a criterion of value. It is not! There is such a thing as inflated value. There are so few small lots in the market, that the competition is keen, too keen, to be justifiable. The small man gets his little plot. It will take him all his time to make it earn anything like a fair percentage, but that is not all. Before he becomes the actual possessor there are fees to the lawyers acting for vendor, as well as the fee his own representative will require, *and we think the expense is far out of proportion to the work done.* We know, of course, that there has been an improvement in the transfer of land, but still there is room for far more improvement.

It is well known that a man will work better for himself than for a master, and naturally he will strive to improve his own property to the best of his ability, and by thus doing *adds to the health of the community.* There is another point we are very anxious about just at present. Some say we are on the eve of a general election, others pool, pool, the idea altogether. It may come upon us as suddenly as did the last, and where shall we, as farmers, be in case the party in power will not renew the relief that has of late been afforded in respect to the rates laid on agricultural land? Most of us will think that if anything, we shall want rather more relief. What if we lose that which we have already obtained? We see to-day one generous landlord has remitted the whole of the half year's rent. Many may be willing to help their tenants, but very few can afford, in justice to their own families, to do so. No doubt there will be some handsome returns, but we think that we cannot fairly look to landlords to do much more than they have been doing, and it will very ill fit with present times if we are to go back to our old and heavy ratings.

\* \* \*

Now to another subject. Here we are short-handed. There is work to do, and very few men that can be found to do it. This district is not peculiar in this. Look through any agricultural paper, and complaints as to the scarcity of men will be found to be most general. Wages are good; houses are cheap; hours are short. Farmers don't do much work by candle power. This is how we are fixed. Now turn to another aspect of affairs. On Friday, December 4th, a labour bureau was opened for the unemployed in a large city in the N. of England. Before 5 p.m., 1,171 men had entered their names as desirous of a job. If the Corporation can make work they will, for good men, provide employment for three days in the week, and pay 11s. 3d., preference being given to married men with families. Of course we know it is the old story—Impossibility of getting master and man in touch; but surely this should not be so in these days of easy transport. Why do the men flock to the towns? Certainly not in this case to better themselves. Of course it will be urged that many of these unemployed would be of no use on the land. There we think is a mistake. The towns are recruited from the country, and they are not submerged or lost. The Irish workers who come over at harvest time, manage to leave their wives and families behind for a season, and surely the same might be done if these townsmen really wanted a job badly. We fancy they have not much stomach for dirty, wet, cold field work.

\* \* \*

We have scattered throughout the country many experimental farms; some of long standing, some comparatively modern. That they are of service to the cause of agriculture, few of us doubt; but there is a great doubt as to whether they might not be even more beneficial than they are. They cannot extend their operations if short of funds, and there is a general feeling that any supplementary funds must not be derived from the rates. Here is a great danger to guard against. These experimental farms must not be looked upon as happy hunting grounds for professors with fads, who want to work out little pet theories. We sometimes wonder if the committees of management are quite qualified to guide the professors, or whether their management exists in name only. We don't want to saddle ourselves with old men of the sea, who choose the tune while we pay the piper. There are people crazy for anything new and untried, or perhaps comparatively untried. The fact that a thing is new is quite enough. The new thing before the public at present is the motor, as applied to field work. No doubt it is one of the most useful of modern inventions, but we are not disposed to part with all our shires at once and invest the money in motors. We doubt whether the money would go far enough! However much work a motor can do, or however quickly, there is one certain fact:—it can't be in two places at

once, nor can it be occupied on two jobs at one and the same time. It may be used to supplement, but not entirely to supersede, horse power. A very small lad can be trusted out with a cart and horse, to fetch a load of Turnips, but we doubt if many "big boys,"—that is, inexperienced farm men, could be trusted out with an expensive motor. We shall have to have a race of mechanical labourers trained before we are ready for motor power, and it alone.

Farmers' sons and pupils may enjoy the management of the motor now, whilst it is a novelty; but when the charm of novelty has worn off, their enthusiasm will have paled. We have found that machinery has a way of breaking down at critical moments, and we have also found nothing quite so bad to sell as machinery that is not up-to-date. We doubt if, at a farm sale, two or three motors would make anything like the money they cost: whereas the teams of draught horses are always a very convertible asset. Until the price of the motor gets a little lower (£350), we scarcely would advise the farmer of a medium-sized farm (of 400 acres) to sell his light horses and invest in one.

A great point in favour of the motor is that, on strong tenacious clays, there is little treading. We do not know the exact proportion of strong v. medium, and light soils, but we still hold to the opinion of others, wiser than ourselves, that the treading of these soils during cultivation by horses, is a decided advantage. Wheat must have a solid seed-bed, and to be kept free from the ravage of wireworm, hence the solidity of the soil must be maintained.

We can afford to laugh at those visionaries who would have us cut corn and thresh it the self-same day, because the seasons when such operations would be successfully carried out will only come once or twice in the longest lifetime. The writers who suggest such things must know very little about "conditions." However dry corn may appear when led and stacked, it invariably gives again, and there is nothing that puts doubtful grain into such good "fettle," as being in a well-made stack. We are told, too, we are in the habit of cutting all our corn too green, hence the inability to thresh and sell at once. If the corn were the whole and sole object, we could afford to let it stand till dead ripe: in that case the valuable straw would lose a great deal of its nutritive quality; beside, too, a gale of wind playing upon very ripe corn in a few hours would make it not worth cutting or threshing.

There is another point, too, that needs consideration. If all farmers threshed at once, the markets would be flooded with indifferently samples; for certainly on no farms we know, is the granary accommodation equal to the proper preservation of the entire grain crop: and as one, or at most, two days' threshing, fills the barn to repletion with chaff, a great quantity of valuable food would stand much chance of being lost or wasted.

### Work on the Home Farm.

Changes from frost to snow, from snow to rain, and back again to frost, have quite put an end to all ideas of finishing off the Wheat sowing, and if we sow any more it must be put in early in February. We are able to continue ploughing lea for Potatoes, but the work is harder for the horses than it was. We have noticed young Wheat showing above ground in one or two fields. One which would otherwise have looked rather promising has been cropped off by rabbits from a neighbouring cover, which is rather hard on the tenant in these times.

On any but the driest soils sheep are having a bad time in the Turnip fold, which is a mass of batter. It seems folly to keep sheep on Turnips under such conditions, but recent experience has taught farmers that it is wise to get their roots eaten off and their spring corn sown in good time. So many late-sown crops have been ruined by wet weather that everyone now is making a special effort to sow early. We fancy there are not so many spare roots this year as last, as Swedes are decidedly on the small side, and as there is plenty of grass in the old pastures, we should prefer to take our sheep on to sound lair and risk being late with the spring sowing.

Everyone is busy pig-killing. Farmers who are not killing for their own use are killing the pigs which form part of the wages of the yearly labourers. Food has been plentiful, and pigs are weighing well. A few words on bacon-curing may not be out of place. For a large pig, 4oz of saltpetre should be used, and well rubbed into the meat before the salt is put on. We use a large 6d. lump of salt, which is first well crushed. A little is laid at the bottom of the salting-tub, then the hams, after having been well rubbed with saltpetre and then with salt, are laid with the cut side upwards in the tub. The shoulders, which we always sever from the remainder of the flitch, are served the same way, the flitches being laid on the top. A little salt is laid on each portion, but more on the hams and shoulders than on the flitches. We have begun our Xmas markets, but the beef trade is disappointing. The mutton trade is good.

## Journal of Horticulture.

THURSDAY, DECEMBER 24, 1903.

### Christmas Gifts.

THE year will soon have run its course, and as it passes into the mists of the mighty past the dawn of a new era will rise before us, and the fervent hope of millions of Britons must assuredly be that the new will be better than the old. It is well that the close of the year brings with it the joyous season of Christmas, when the interchange of gifts and kindly greetings does much toward softening the sternness of life's struggle, and thus creates a reserve of mutual goodwill with which to begin another year. There is usually not much difficulty in deciding as to the most suitable form of gifts to the needy, as some of the many necessities of life are doubly welcomed in the depth of winter, and I for one should not like to see the number of such gifts curtailed; rather would I rejoice to see them greatly increased. Christmas gifts are, however, freely exchanged between friends and relations who fortunately are not in need of any of the real necessities of life, and thousands under such circumstances must often have been sorely puzzled as to "what to give." Let me ask them in such instances to remember the word "garden" and the multitude of good things from it, and for it, which would gladden the hearts of hosts of individuals who are interested in gardening, or if not so already, might be the means of bringing them into the fold. Something which will live and grow and last for years, forms one of the best of all mementoes of favourite individuals or of special times.

To those who have a garden and delight in Roses what a feast of pleasure will be associated with the receipt of a dozen or two of Rose trees, including old favourites as well as some of the newest gems. A favourite flower associated

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

with the name of a favourite individual is doubly prized. Do not then forget the Roses when gifts are being ordered. Some, again, will need to think of elders who have advanced far on life's journey, and are able to spend much of their time in that finest of all recreations—gardening. The flowers of their youth will probably appeal to such. Some good corms of double and single French Anemones would, perhaps, find special favour in instances of this kind; and do not forget to include a few of the St. Brigid type, which are queens among Anemones to-day. Some of the best strains of Primroses and Polyanthus might, in some cases, be substituted, and the charms of the Ranunculus should not be overlooked.

Among the herbaceous plants there is a wealth of material to select from, and an excellent collection could be obtained from prominent growers which would provide a succession of flowers during nine months of the year. Among this section the brilliant beauty of the Pæonies, Iris, New Michaelmas Daisies, Pyrethrums, Chrysanthemums, Hepaticas, and Delphiniums should not be overlooked. In fact among hardy perennial plants alone thousands might find an easy solution of their present puzzle as to what to give.

An enthusiastic Chrysanthemum grower might receive a pleasant surprise in the shape of some noted speciality—"Latest set;" and a dozen packets of seeds of the very best varieties of Sweet Pea would set many an individual longing for summer time, let us hope not to the extent of being in too great a hurry to sow the seeds.

The Christmas tree, the well grown pot plant in the shape of either a Palm, Erica, Solanum, or Fern, are mementoes often sent round at the festive season, so I need not dilate upon their merits, but will pass on to things which have utility as well as beauty. It is certainly not necessary to say anything to add to the craze for certain varieties of the "noble tuber." Those who mean to have Northern Stars will take steps to secure them independent of surprises which Christmas may bring, and it seems difficult even by the aid of a "long purse" to secure "Eldorado." Let us therefore pass on to fruit trees. I can imagine no more useful or acceptable gift to the owner of a garden than a few good Apple and Pear trees. If for planting on grass of course standards, but if for the garden proper Apples on the Broad-leaved Paradise stock, and Pears on the Quince, so that it may not be a question of waiting years for fruit. Here are a few excellent varieties for the purpose:—Apples, dessert: Lady Sudeley, Quarrenden, Cox's Orange Pippin, King of Pippins, Allington Pippin, Scarlet Nonpareil, and Charles Ross. Cooking: Early Victoria, Stirling Castle, Golden Spire, Warner's King, Bismarck, Newton Wonder, Lane's Prince Albert, and Annie Elizabeth. Pears: Souvenir du Congrès, Marguerite Marrillat, Marie Louise D'Uccle, and Doyenné du Comice.

The children should not be forgotten, as it is well to get them interested in Nature's handiwork: and if in addition to their usual gifts they receive a few plants or seeds for spring sowing, the delights of gardening will grow upon them as they advance in age. The value of suitable books on gardening should not be overlooked, for to either old or young such will invariably prove a source of delight as well as of valuable instruction, and it would certainly be difficult to estimate the mighty part which books have played in creating and maintaining the keenest interest in our ancient art. May that interest increase still more as time goes on, so that every individual will be led to look upon their life as being incomplete unless some form of gardening enters into it either as a recreation or a daily calling. We can all do something through the medium of Christmas gifts to spread the spirit of gardening abroad, and the blessings it brings in its train.—ONWARD.

## Question Night.

It has been customary with secretaries and committees of gardeners' mutual improvement societies in preparing their sessional syllabuses of essays and lectures, to fill up odd occasions with a Question Night. Again, hard pressed secretaries whose dates of meetings are more numerous than the contributors of papers, have perforce to make the Question Night a stop-gap. We would be inclined to set aside half the meetings of the session of almost the best mutual improvement societies for open nights, to be entirely devoted to questions and impromptu discussions. There are scores of doubts in all men's minds, and

gardeners, both old and young, have abundant doubts and difficulties that continually arise. What more fraternal, what more helpful, what more inspiring to the anxious practitioner, than to put a question to an assembled body of his fellows and obtain the benefit of their varied experiences? True, there may be so many and divers opinions that a fresh difficulty would arise as to who was right, or whom to follow; but a logical mind could be trusted to resolve the leading facts.

There is another aspect of the Question Night, for out-of-the-way queries are very frequently put to the company, and are indifferently answered as a matter of course. But their usefulness may ultimately double itself if those to whom it was addressed will investigate its application in the quietness of their own homes or gardens, or by a diligent search in books of reference wherever these are accessible. Could there not be periodic debates on matters of moment? For example: The Proposed National Potato Society; the Proposed National Gardeners' Association; the Future of Market Gardening and Fruit Growing in the British Isles, and many similar topics would furnish matter for discussions of absorbing interest and of considerable utility.

The methods adopted at Question Night are simple. Each member should go prepared with a question. This he writes on a slip of paper, to be handed to the chairman or secretary. The slips are placed in a box, or hat, and passed round, each man taking out a paper, which he must try to satisfactorily answer, or can call upon someone else to assist him if it is out of his range of experience. An alternative plan is for the chairman to read the queries, and anyone present may respond. But the first method is the best.

## The "Daffodil King" on Tour.—No. 11.

(Continued from page 213.)

Mr. Peter Barr is again on the point of making a tour, this time to Egypt, Palestine, and Greece, and he has requested us to conclude, if possible, the notes we still possess from the interviews enjoyed with him after his return from the long tour which this series very briefly describes. It may be remembered that the last instalment dealt with the conclusion of his visit to New Zealand, and his entry into Tasmania. Having arrived at Launceston, and been "taken in hand" by the Daffodil amateurs, Mr. Barr worked down the west coast of Tasmania. This part, in the early days of settlement, provided Melbourne with Potatoes; but the industry is now almost nil, Tasmania being thickly populated, and Melbourne being able to supply its own needs in this direction.

The west coast region is remarkable for its heavy rainfall, though our traveller enjoyed most charming weather, which he ascribes to his usual good fortune. Mr. Barr visited copper mines here, and from Hobart made an excursion to the fruit growing districts, which supply England with those handsome Apples we see during spring and early summer. He also journeyed to the old convict station, but previously equipped himself by reading as much as possible of the literature pertaining to the terrible times when criminals were put in durance vile. Many a good man was turned into the vilest of the vile, and it was no uncommon thing for an escaped prisoner to turn cannibal. It is from this part that the timber is, or has been, cut down for the making of the new Dover pier and harbour.

Returning, Mr. Barr took the east coast route, which is full of interest from its coal and tin mines, and—its Tree Ferns. The itinerant stayed at various centres to inspect the works, then joined the railway back to Launceston.

His next move was one of even greater interest still; certainly more romantic. This move was to Fiji, Samoa, and Tonga, by the New Zealand Steamship Company. The boat was charming, the food was good, and the officers all fine, gentlemanly men. If we survey a map of the Southern hemisphere, we will find these islands lying far out in the Pacific Ocean, under the scorching tropical sun. The Fiji group lie, roughly, 1,500 miles east of Queensland (Australia), which Mr. Barr also touched, and about 1,000 miles north of New Zealand, and the same distance south of the Equator. The Samoan group are 1,500 miles due north from the nearest point of New Zealand, being therefore near the Equator, and are fully 2,000 miles from Queensland. These distances will give the reader a better understanding of this latest voyage of Mr. Barr's tour. The Fiji Islands are a group mainly of volcanic origin, their total area being less than a third of that of Tasmania. The islands were ceded to Britain by their native King in 1874, and now form a British Crown Colony. In passing, one may observe that many Europeans voyage here for health's sake, and Mr. McIntyre, head gardener to Sir Charles and Lady Tennant, of The Glen, Innerleithen, Peebles-shire, N.B., was in this region recently, but returned some time ago.

The chief industry is the growth of the Sugar Cane, and the extraction of the saccharine juice, the plantations being worked by coolies brought from Indian territory. The home Government have several sailing vessels going back and forward between Bombay and Calcutta, bringing new apprentices and returning time-expired men. These coolies are well looked after, as each plantation has to find suitable housing. A regulated dietary is enforced, and a doctor attends. Each coolie is apprenticed for five years. At the termination of that time they can put in another five years as free men, and at the end of ten years they are returned, if they so desire. Each coolie costs the planter £35 to bring over. Many of these coolies prefer to remain on the island, and some of those who go away come back again, "so that," added Mr. Barr, "there is a danger of Fiji becoming a coolie settlement."

Tea of superior quality is cultivated on an island off Lavouka by a Mr. Robbie, a Scotsman, who is also a shipping agent, and there is at the new capital a botanic garden recently established by the former Governor, Mr. Thurston; but the situation, Mr. Barr thinks, was badly chosen. Trees can only be grown on raised banks, owing to the level ground being within two feet of salt under-water. Mr. Barr communicated with the Director of the Royal Gardens at Kew, who replied that he had placed the matter in the hands of the proper authorities, and that there was likely to be a change. It reflects with discredit on a Governor who cared only for Roses for his own table, and who denied the curator the freedom to make exchanges of plants and seeds with other stations and botanical gardens. It also points to extreme ignorance on his part of the primary duties of his office.

While at the Fiji botanic garden Mr. Barr saw many variegated Coleuses, and the curator informed him that all had been collected wild from the "bush." The veteran asks whether it be possible that Mr. Bause might not have had a packet of seeds from Fiji as a starting point?

The islands are very interesting, and all the merchants seemed to be doing well. Mr. Barr mentions having seen numbers of natives intoxicated in one of the refreshment houses, through drinking a native preparation. Lavouka, the ancient capital, is a busy little place.

Samoa is a German settlement, but it did not appear that the Germans were particularly prosperous. Here Mr. Barr visited R. L. Stevenson's tomb, which was in perfect preservation, and likely to remain so for thousands of years, provided that relic hunters left it intact. Our traveller had read in a Scottish paper that the tomb was neglected by the natives, and was going to ruin, but this was absolutely untrue. "If Stevenson's friends and admirers desire to do something," said Mr. Barr, "let them put a rail around the tomb."

Samoa is a great centre for Cocoa-nut Palms, and the unripe fruits yield a cool refreshing drink. When sufficiently young the meat has not formed in the nut. A little native boy climbed up one of the trees like a monkey, and threw down the nuts.

In Tonga Mr. Barr made an effort to interview the King, but the latter was somewhat shy, though he promised an interview. Later on, however, he sent to say that he was so much occupied with business that he regretted he could not see the itinerant. The messenger assured Mr. Barr that the King was a very hard-worked man, and that the concerns of state occupied much time and thought. Mr. Barr also had the opportunity to visit several adjacent islands in a steamer engaged in collecting copra, which is the dried Cocoa-nut. This is sent to Europe to be used in confectionery, biscuit manufacture, and also is used in high-class soaps. From here Mr. Barr returned by way of New Zealand to Sydney.

The next tour was in a different class of steamer—the type employed for conveying missionaries and their goods back and fro among the islands. Lord Howe's Island was the first place of call, and here a magistrate was put off, who periodically sojourns among the natives to deal justice in cases of dispute. At the port, here, there was the beginnings of a fish-drying establishment. The sea running somewhat heavy, the passengers were not allowed to land, and so the ship made for Norfolk Island, the home of the Pine of that name, or, botanically, *Araucaria excelsa*. Here the party remained for some hours—sufficient time to cross the island and view the old convict establishment. On the walls of many of the old cells there were the names of the bygone prisoners, written, doubtless, by themselves. After removing the prisoners from there, the island was allotted to the families of the mutineers from the Bounty, who started business by sheep rearing; but they soon grew dissatisfied with this, and now there is scarcely a sheep on Norfolk Island. The Church of England has a missionary college here, for training native preachers, who also are sent to Banks Island. The *Araucaria* already mentioned is very abundant, and some handsome specimens are to be seen, but other trees of the same species in Australia and even South Africa, according to Mr. Barr, will compare favourably with the indigenous representatives.

(To be continued.)

## Novelties, or Improvements in Flowers.

The perusal of some of the beautifully got up and handsomely illustrated seed catalogues which one usually receives at this season, has reminded me of a morning in July last. Having come to judge the Roses at a certain annual flower show, I had an hour or so to wait for the appointed time, and between some showers wandered with permission into a good-sized field adjoining the show ground, which was being used as a seedground for flowers, many of which were of more or less new strains or varieties.

Among these I strolled as a complete outsider, with, in many cases, as much ignorance of the "manners and customs" of the plants I saw as "the man in the street," and yet I hope with that feeling of the general principles of beauty which can hardly be absent from one who *does* know a little about *some* flowers. The thing that struck me was that if a flower was novel, with any variation from the type, it was preserved and propagated and cherished without any thought as to whether the variation was an improvement or not.

Of course, it may well have been that the final selection as to whether the novelty was an improvement or not had not yet taken place, and was waiting for expert decision as to whether it was worth sending out, &c. And, again, I am so ignorant in the matter that many of the things I thought novel were very likely nothing of the sort, but comparatively well known.

However, I think many will agree with me that a novelty is very often sent out because it is a novelty, without much thought as to whether it is an advance in beauty on the type; and, though I took no notes, I can remember the thoughts which struck me as to three or four of the flowers I saw.

A white double *Campanula* with the "bell" entirely filled up with an irregular mass of half-formed white petals; it was a bell no longer, but solid, and a microscopical fairy could not have got inside it. Surely this was emphatically a variation for the worse, and not for the better.

Summer or annual *Chrysanthemums*, double, or rather semi-double, the "eye" completely spoiled by some of the stamens being half formed into petals, were there. Those I saw were neither one thing nor the other; neither double nor single, the characteristic beauty of either a double or single flower being entirely absent. For perfection, more is required of a double flower than a single; but a single must maintain the beauty of its "eye," as well as of its petals, or its glory is lost.

Then I remember to have noticed a large quantity of *Candytuft*, a flower that seems to have been improved but little compared with many others. It was of the ordinary lilac colour, paler towards the centre, which may be, for all that I know, the usual habit. It seems to me to give an impression of weakness; the centre of a flower, to my idea, should always be its strongest point, whether double or single. I look upon the centre of a Rose as far more important than the outline of the outside petals, just as I should dwell more on my lady's face, and especially on her eyes, than on the edges of her skirts. The petals of a flower direct our sight, as they are intended to guide insects, to the centre; and that centre or eye should be, I think, as in *Hibiscus*, of more intense colour than the rest of the flower. It generally is so, and where, as in the case of this *Candytuft*, the centre is a weaker shade of the same colour, an impression of weakness and poorness is given to me.

Next I remember some *Antirrhinums* that for dwarfness of habit appeared to have got to the furthest possible limit. I suppose these are the "Tom Thumb" varieties. Well, "General Tom Thumb" (I remember him) was a "monster," i.e., a malformed creature, contrary to Nature, and to my mind the intermediate forms of *Antirrhinum* are quite dwarf enough; but perhaps this would be more a matter of individual taste than the other examples I have mentioned.

*Mignonette*, too, I remember, so gigantic in spike that the foliage looked unnaturally out of proportion. And in this case the beauty of the spike itself seemed to be lost because of its size, for in medium development not more than two or three rows of florets in the centre of the spike were in flower, those above them being in bud, and those below them in seed, and thus the whole spike was never in full and perfect beauty. Moreover, have not those large spiked strains suffered from want of scent?

These are criticisms from one who is confessedly ignorant of annuals and perennials beyond the knowledge which comes from a general love of flowers; and are only meant to warn those who are equally uninformed that novelties are not necessarily improvements.—W. R. RAILLEM.

AN IMPORTERS' NATIONAL ASSOCIATION.—A movement is on foot in the U.S.A. to organise an Importers' National Association, the object of which is to intervene for the protection of its individual members from injustice, to prevent undervaluations, and to establish the proper rates of duty on imported merchandise, &c.

**Cypripedium × Arthurianum pulchellum.**

*Cypripedium Arthurianum* resulted from a cross between *C. insigne* and *C. Fairrieanum*. It is fairly well known, and is a good grower. The petals are pale green faintly spotted with purple in the lower half, veined with deep crimson in the upper half, and turned downwards like *C. Fairrieanum*. The dorsal sepal is pale yellowish green, broadly margined with white on the upper part, veined with blackish crimson. The lip is veined and mottled with brown on a pale greenish yellow ground. The flowers appear in the autumn months and continue a long time in perfection. *C. Arthurianum pulchellum* is much superior to the preceding, having a broader dorsal sepal, which is covered with larger spots, and is richer and deeper in colour. The former was first shown on October 10, 1882, and the latter (J. Veitch and Sons, Limited) November 1, 1892.

**Masdevallias.**

There is probably no more interesting or fascinating genus of Orchids in cultivation than *Masdevallias*, and certainly no other contains such a wondrous variety of form or beautiful combinations of colouring.

The lover of the grotesque will delight in such exquisite little gems as *M. Estradæ* and *M. trochilus*, or the wonderful *M. Chimæra*, while those who look for brilliant colour and simple form will find ample to please them among the *Harryana* and *Lindeni* section. *Masdevallias* as a genus are not difficult to cultivate, but they show the results of indifferent treatment sooner than many others. For instance, an *Odontoglossum*, or even a *Cattleya*, may not have a sound root in the pot in which it is growing, and yet an inexperienced person would not for a time detect anything wrong by the appearance of the pseudo-bulbs or leaves, because the stored-up nutriment in the former keeps the plant going for a time without much assistance from the roots, and may perhaps produce a few flowers. *Masdevallias*, on the other hand, if once the roots get in a bad way, show the effect almost at once, as they have no pseudo-bulbs to sustain them, and are naturally more sensitive to atmospheric changes.

The roots then, and how to conserve them, must be the grower's first care. Anyone who has had a little experience with Orchids will have noticed how these delight in rambling about over the hard, porous surface of the pots where they are fully exposed, often quite dry, and have nothing of a close nature about them. Here then is the cue for root preservation, and in preparing the compost for these beautiful plants growers must keep in mind the necessity of providing for a constant supply of air to the roots, at the same time checking too rapid evaporation, and providing the necessary nutriment. The plants must not be dried at the roots at any season, but no stagnant moisture must be allowed to collect about them. They all thrive in a cool house during the summer, and must have a light airy position shaded from bright sunshine.

The winter temperature must not be allowed to fall much below 50° for the *Chimæra* group, while 45° is quite low enough for the *Harryana* and *Veitchi* sections, and in fact for any cool house Orchid. The chief insect enemy to *Masdevallias* is the yellow thrip, and unless constant war is waged against these they soon get the upper hand, ruining the appearance of foliage and flowers. *M. amabilis*, *M. Harryana*, *M. Chelsoni*, *M. Veitchi*, *M. ignea*, *M. coccinea*, and *M. Lindeni* will be found a good selection of the showy flowered types. These are natives of Peru and New Granada except *Chelsoni*, which is a hybrid raised by Messrs. Veitch & Sons from *M. Veitchi* and *M. amabilis*. *M. tovarensis* is the only well-known white flowering kind.

*M. Chimæra*, *M. Backhouseana*, *M. Bella*, and *M. Wallisi* are amongst the most marvellous productions of the whole Orchid family, and I hope to refer to the culture of these more fully in the near future. Of the small flowered section *M. triaristella* and *M. triangularis*, as well as those named above, are free flowering, elegant, and very interesting species.—BRISTOL GROWER.

***Sophronitis grandiflora*.**

Few plants are so charming during the dull winter days as the *Sophronitis*, especially this fine species. It produces flowers of immense size when compared with that of its pseudo-bulbs, and this, too, with great freedom. The individual flowers are upwards of 2in across, of a glowing scarlet, and thriving as it does in quite a cool house, it is an excellent plant for all classes of growers. Like all dwarf Orchids it dislikes a large amount of compost about its roots, but likes a thin, well drained, firm medium that will keep in good condition for several years without disturbance.

Small pans suspended near the roof of the *Odontoglossum* house or a house kept a trifle warmer are suitable for this and its variety *purpurea*, but the dwarfer tufted sort, *S. cernua*,

thrives well on a lightly dressed rough wooden block. *S. violacea* is more difficult to grow than either, the best plants I have had being grown on a piece of Tree Fern stem. It is less tufted than either of the others, and not so showy. *S. cernua* is the oldest species, having been in cultivation since 1826, the others having been introduced at a later date from various stations in Brazil.—GROWER, Bristol.

**Orchids at Chelsea.**

Messrs. James Veitch and Sons, Limited, of the Royal Exotic Nursery, Chelsea, recently had a very rich display of Orchids in flower. The dense fog of two weeks back must have scorched and destroyed hundreds of the tenderer blossoms, yet more have opened and are still opening. It was surprising to learn that such large quantities of certain species are grown. Thus of *Cattleya labiata*, some 700 plants are cultivated; *C. Mendeli*, 400; *C. Trianae*, 500; *C. Mossiæ*, 500; and *C. Schröderæ*, 500. All of these are flowering well, or ready to unfold. The plants are healthy, with green coriaceous leaves and fresh, plump white roots. *Lælia purpurata* was represented by a large collection of specimen plants in 10-inch pots, each plant having four or five leads.

*Dendrobium Wardianum* hangs from the roof of a warm Lily house, in small pans, and the stock of *D. nobile* was also large and highly satisfactory. *C. Bowringiana*, whose flowers are so useful for breast bouquets, was in fine condition, and of course *Oncidium Forbesi*, *O. tigrinum*, and *O. crinitorhynchum* were in full beauty of blossom. *Cattleya Dowiana* in hanging pots, and *C. D. aurea* in large pots well up to the light, were objects of envious interest. *Vanda cærulea*, the "true blue," is always worthy of attention.

There were some attractive new hybrid *Cypripediums* in the smaller pits. *C. x Little Gem* was one. It resulted from crossing *C. Harrisianum superbum* with *C. x Baron Schröder*. The dorsal sepal is bold and fine, flushed a blush-purple, and edged white. The petals droop a little; the pouch is rosy.

*C. x Catherine* came from *callosum Sanderæ* and *superbiens* (syn. *Veitchi*), pale creamy ground, the delicate petals and sepals spotted with dark red. It is a very graceful and sweet little flower.

*C. x Memnon* from *C. Spiceranum* and *Charlesworthi* shows the trace of both parents, but the latter predominates. It has a pretty rose-mauve dorsal sepal, with a deep greenish-brown base, and a brown pouch. The *Leeanum* varieties were particularly sturdy.

**Cultural Notes: Saccolabiums, Dendrobiums, Vandas.**

*Saccolabium giganteum* and its varieties are now in flower or approaching it, and the elegant spikes are very welcome. It is not one of the best of growers, though for a few years after importation it gets along fairly well, and it is not wise to allow the spikes to remain on too long. The fact of their appearance at the dead of winter is against the health of the plants, and frequently leads to a shrivelled state of the leaves from which they recover slowly and with difficulty. A moderately dry state at the roots and in the atmosphere is necessary now to induce rest until the spring, when the conditions for growth will be more suitable.

Among other *Dendrobiums* advancing for flower will be the quaint Australian species *D. speciosum* and *D. Hilli*, and though very often the pseudo-bulbs of these will often be considerably shrivelled owing to the drying in autumn, it is not well to overwater them yet. There will be ample time later to put all this right. Should signs of new roots appear as they occasionally do, a little surface dressing may be given; but the plants must not be disturbed at the roots. The variety *Bancroftianum* is a more slender grower, but a very charming plant. It usually flowers later than the type, and from now until the spikes show plainly must be kept dry.

Drip is a source of much danger to Orchids at all times, and especially now when the inside temperature is so much higher than the outside. Basket plants suspended from hooks screwed into the rafters are almost sure to suffer, as the hook and wire carry the drip direct to the centre of the plant. In all cases it is better to have a light iron or brass rod running the whole length of the house for suspending baskets from. These can then be hung between the rafters, when, of course, the risk is much less. *Cattleyas* and other kinds that form cup-like growths must be frequently examined now and turned upside down to allow any water that has gathered to escape.

*Vanda Amesiana* as it goes out of flower may, if necessary, be top-dressed with a little sphagnum and crocks; but any plants that require a new basket must not be pulled about yet; as there would be considerable risk of their not re-establishing themselves. When grown too cool the stems of this pretty species are apt to decay just above the surface line of the compost, and when this occurs the plants should be shaken quite clear of the pot or basket and replaced a little lower, using only clean crocks. More warmth should then be allowed, and the plants treated like newly imported specimens.—H. R. R.

## Old-Time Gardening.

(Continued from page 346.)

In an early paper of this series, the part played by "adventurers" and merchants in the reign of Elizabeth in the introduction of exotics into England has been noted, and, as a corollary to that, mention may now be made of what occurred in this connection in the century succeeding. The most notable of the early introducers of new plants were undoubtedly the Tradescants, father and son, the former of whom is supposed to have been the son of a Dutchman of that name who settled in England in the latter part of the 16th century. They were held in much esteem in England, and so late as 1709 we find Steele in "The Tatler" making reference to John Tradescant as a collector of curiosities.

If we are to credit Hawkins ("Walton's Complete Angler"), the first Tradescant was gardener to Queen Elizabeth, and the one now known as the "Elder Tradescant" was also employed in a like capacity by that Sovereign. Parkinson relates how he made journeys on the Continent in search of rarities in the vegetable kingdom, and while with the Earl of Salisbury he left an account of what he bought, with prices, on a journey of this nature in 1611. He made purchases at Leiden, at Haarlem, and at Parrys. "An exceeding great Cherye called the Boores Cherye" cost 12s.; "The double Echatega (?), the martagon pomponne blanche (Lilium Martagon album), the martagon pompong orang collar (Lilium pomponium), and the Irys calcedonye and the Irys susyana (Iris pallida and I. susiana)" cost £2; "Vynes called Muscats, two bundals of plants, 4s."; and "8 pots of Orang trees of on year's growth, grafted, at 10s. the piece," are examples of his purchases at this time.

In 1620 he made a journey to Algiers, and gathered much spoil on that occasion. Of *Gladiolus byantinus*, as he informed Parkinson, he saw acres growing in Barbary, and from Algiers he brought several sorts of Apricots. He travelled also in Turkey and Russia, and in a nursery he established at Lambeth—but previous to which he was gardener to Lord Wotton at Canterbury, by whom "Finocchio" was first introduced, and perhaps while he was gardener to the Duke of Buckingham—he had a very complete collection of Plums, many of which he had introduced from abroad. He also introduced to cultivation in England the beautiful *Pyrus Aria*, a tree not nearly so much planted as its merits entitle it to be.

The introduction of *Tradescantia virginica* has generally been attributed to either the father or son. As a fact, the elder Tradescant, as we gather from Parkinson, was presented with it by a person who brought it from Virginia for a kind of *Asclepias*; yet it is more generally known than any other of his own introductions, and long after his day was called by his name. As to *Aster Tradescanti*, it is first mentioned by Johnstone in 1633 as growing in the "gardens of Mr. Tradescant, Mr. Tuggye, and others," and "reported to be a Virginian."

From this authority we gather that Tradescant was a large grower of Auriculas, and had also *Aristolochia serpentaria*, *Pelargonium triste*, *Spiraea Aruncus*, *Scolymus maculatus*, *Trifolium rubens* ("from Fermentera"), *Phaseolus multiflorus* "was procured by Mr. Tradescant, and growes in our gardens, is a large plant, not differing in manner of growth from—Kidney Beanes, but his floures are large, many, and of an elegant scarlet colour, whence it is vulgarly termed by our Flourists, the Scarlet Beane." *Jasminum fruticans*, *Laburnum*, *Anagris foetida*, Horse Chestnut (then rare), and Oriental Plane are other plants he grew. His son, who visited Virginia in pursuit of plants and curiosities, gives in "Museum Tradescantianum" a list of plants and fruits cultivated in his garden. The museum itself was bequeathed to Ashmole, who, in turn, left it to the University of Oxford, and has been long known as the Ashmolean Museum.

Early in the 17th century, voyages were made to China, Japan, India, Sumatra, and other eastern islands, and "factories" established; while at the same period the West Indies, the Bermudas, Jamaica, and new settlements in North America were regularly traded with. It was, of course, impossible to acclimatise tropical plants in England at this period, because the hothouse was still a thing of the future, though some were wintered in cellars; but in the good lists of common garden flowers noted by Evelyn in 1664, it is not without interest to find such as *Podophyllum peltatum*, *Lobelia cardinalis*, *Passiflora caerulea*, *Asclepias virginica*, Marvel of Peru, Persian Lilac, common Lilac, *Jasminum grandiflorum*, *J. odoratissimum*, *Canna indica*, *Cyclamen persicum*, *Datura fastuosa*, *D. metel*,

*D. tatula*, *Eryngium planum*, *E. alpinum*, *E. amethystinum*, *Eupatorium ageratoides*, *Mimosa pudica*, *M. sensitiva*, *Lychnis Viscaria* var., *Scabiosa atro-purpurea* vars., *Cineraria ragusina*, *Yucca gloriosa*, *Agave americana*, *Nerine sarniensis*, *Brunsvigia multiflora*, *Argemone mexicana*, *Spiraea salicifolia*, and altogether, at a rough count, there would be 400 plants, with varieties, in cultivation.

The varieties of fruits cultivated were also greatly increased, in Pears especially, a very great influx of French varieties occurring about this time, a selection of these continuing to be cultivated till about a hundred years ago. At this period too, a few Apples of French or Flemish origin were introduced. Hartlib edited "The Legacy," the product of several writers, and another work on fruit trees, from which we gather that 500 varieties of Apples were thought to have been in cultivation at the time of the Commonwealth. In the last-named work, one of the writers quaintly remarks:

The poor man's child invited was to dine,  
With flesh of oxen, sheep, and fatted swine.  
(Far better cheer than he at home could find),  
And yet this child to stay had little minde.  
"You have," quoth he "no Apple, froise, nor pie,  
Stew'd Pears, with bread and milk, and Walnuts by."

This is one of those remarkable sayings that cast a much-needed light on the domestic economy of the poor, about the

*Cypripedium Arthurianum pulchellum.*

life of whom scarcely anything occurs in old histories. An equally interesting statement was made a few years later by Worlidge to the effect that fruit trees in the South of England were largely planted in hedgerows in exactly the same manner that Damsons are grown in parts of Cheshire to-day.

The Continental wars had, no doubt, ultimately a good effect on gardening in England, and the custom of young men of family spending a few years in travel on the Continent would contribute materially to its advancement. A perusal of the early part of "Evelyn's Diary" makes this abundantly clear, and the tastes he acquired during his travels were not once lost during the whole course of his lengthened life. Sir W. Temple affords another instance of an Englishman enriching his gardens with many foreign introductions, and at the same time introducing improved methods of cultivation, the result of careful observation while acting as Ambassador at various foreign courts, and before him, Sir H. Wotton may be cited as another instance.

We gather from Switzer, that Lord Capel enriched his garden at Kew with many French fruits, and the same writer commends very highly the labours of Lord William Russell, whose character as given in Bishop Burnett's History of His Own Times exhibits a sweet-tempered yet witty gentleman

as a great encourager of gardening. Compton, made Bishop of London in 1676, had served as a soldier, but became the greatest patron of gardening of that age, having as many as a thousand species of exotics in his "Stoves and Gardens." Gardening formed a relaxation from the pressing duties of his exalted office, and he had a constant supply of new plants forwarded by correspondents travelling abroad.

But, it is very clear that England was greatly indebted to the Dutch for many novelties, for, while they, by every means, endeavoured to hinder the English from colonising abroad, or if that failed, to oust them from their factories, the Dutchman was by no means selfish in retaining what his neighbour, in return for a consideration, was anxious to obtain. It was in this way, no doubt, that the earliest Cape plants reached Evelyn and others, and as a fact both French and Dutch traders made annual trips to England with their wares, which they appear to have brought with them and travelled about the country disposing to their patrons. Bonâ fide English introductions were very largely confined to America, with which, once a colony had been established, there seems to have been a fairly constant communication, and as early as 1634 we have an instance where a Mr. Gibb, of Bath, is mentioned as a cultivator of exotics, many of which, he himself had brought from Virginia. The Public Botanic Garden as distinct from the private physic gardens already established in the sixteenth century, had its beginning in that under review, and became the repository of collections of plants that would otherwise have been lost as well as affording a home for novelties of all kinds, but that and other matter must be left over meanwhile.—B.

## Forestry.

### Cutting Trees by Electricity.

It is reported in the German press that successful experiments have been made in various forests of France in cutting trees by means of electricity. A platinum wire is heated to a white heat by an electric current and used like a saw. In this manner the tree is felled much easier and quicker than in the old way; no sawdust is produced, and the slight carbonization caused by the hot wire acts as preservative of the wood. The new method is said to require only one-eighth of the time consumed by the old sawing process.

### Forestry at Park Royal.

The Royal Agricultural Society, it is stated, have decided to hold a British forestry exhibition in connection with the Society's annual show of 1904, which will be opened on the 21st of next June. It is proposed that the exhibits shall be classified in the following seven sections:—(1) Seeds and cones of forest trees; (2) seedling trees and transplant, showing the effects of nursery treatment as to cultivation, manuring, root-pruning, &c.; (3) woods and plantations; (4) timbers, including hand specimens of home-grown woods of various species; (5) insects and diseases, showing characteristic examples of the attacks of game, birds, squirrels, voles, &c.; (6) plans, maps, models, &c., illustrating working plans, forest exploitation, manipulation of timber, &c.; and (7) forest and nursery tools, instruments, and appliances. Specimens of exotic timbers that cannot be produced in this country will not be shown, but foreign-grown specimens, to be placed alongside home-grown materials, will be accepted. Lord Granby is the chairman of the Exhibition Committee, and the principal institutions in this country engaged in the promotion of scientific forestry, owners of forest and woodland areas in Great Britain, and others, are invited to lend their active co-operation in the endeavour to make the exhibition complete and thoroughly representative of British forestry.

### Prairie Tree Planting.

George L. Clothier, at the summer meeting of the American Forestry Association at Minneapolis, said: "Tree planting on the Minnesota prairies has not been as successful in the past as it should have been, because inferior species were largely used. Nurserymen have foisted such worthless shrubs as Diamond Willow upon the public for a fence post tree. Cottonwood, Box Elder, and Silver Maple have been planted on upland sites, ill adapted to the growth of these river bottom trees. Little care has been used in the selection of sites for plantations, and the proper adjustment of the forest plantation to the needs of the rest of the farm has been overlooked. Trees have been planted too close to the dwellings, thus causing snowdrifts to bury the buildings or impede the progress of the farm work. Every Minnesota plantation and farmstead should have an L-shaped protective belt on the north and west, known as a snow-break. To be of any value the snowbreak must be bordered on the south and east by an open space, ten or twelve rods wide, known as a snow trap, into which the drifting snow will collect."

## NOTES

## NOTICES

### A Christmas Greeting.

Sincerely do we wish that all our readers and contributors may pass a happy Christmas-tide, and that the New Year may open and continue to be to them both a pleasant and prosperous one.

### The Chrysanthemum Analysis.

The Journal's Chrysanthemum Analysis is being prepared by Mr. E. Molynceux, and will be published next week. This valuable contribution will thus be published in seasonable time for the execution of orders by the Chrysanthemum trade growers. The analysis will be on a broader basis than heretofore.

### The "Gardeners' Assistant."

Among the resolutions made at the New Year (and we all make resolutions) should be this one: That whosoever does not possess the "Gardeners' Assistant"—which is the fullest and best guide for the practical gardener's study—make the resolve to take it out in parts, as is now being offered by the Gresham Publishing Company. The work is handsome, both outside and in; it has coloured plates and innumerable illustrations; it deals with all phases of gardening; was written by experts; and has just been brought up-to-date. For particulars, see our advertisement pages.

### Extensions at Covent Garden Market.

Visitors who knew Covent Garden Market as it was only a year ago, on re-inspection now, will be able to observe a considerable addition to the buildings of the market area. During the past summer the large vegetable yard or square, which is looked down upon by the offices and shops in Tavistock Street, has been undermined for huge cellars and storage chambers, and overhead there has been reared a large and really ornamental building, quite beautiful indeed if we compare it with the R.H.S. Horticultural Hall! The lower storeys of this square-built edifice form an open shed which at the present moment is fully packed with Christmas evergreens, while above there is a roomy, light, and comfortable floral hall with booths around the walls and two rows back to back down the middle. Each booth or stall has its own private office, walled off. This hall is reached either from Tavistock Street or the upper part of the Market by broad flights of stairs, one from either side, these meeting at the entrance to the hall. The addition has been greatly needed for a long time, and every stall-space is already occupied. It was only opened a week or two ago.

### Snaithing Brook, Sheffield.

Since our notes on Snaithing Brook appeared in the spring, the owner (H. H. Andrew, Esq.) has unfortunately passed away, having died suddenly while in New York. The gardens are very beautiful, and a credit to the gardener, Mr. Sharpe, who has quite a wealth of flowers for Christmas. An immense *Bougainvillea glabra* is still covered with bloom, a splendid batch of *Cyclamens* are in full flower; then there is a grand lot of *Begonia* x *Baron* (?) de Rothschild, which appears to be quite as free as, but with larger flowers and paler in colour than, *Gloire de Lorraine*. There are a few choice *Orchids* in flower, and others are now throwing flower spikes. *Dendrobium primulinum giganteum* has spikes fully a yard long, and showing well for flower. *Coleus thyrsoideus* is also in flower here, the beautiful blue being a welcome addition at this season. There are also Roman *Hyacinths* and *Narcissi*, *Azaleas* and *Poinsettias*; also grand *Primulas* of Webbs' and Fisher, Son, and Sibray's strains. There is still a nice show of *Chrysanthemums*, and the establishment will apparently not be short of flowers or flowering plants for the Christmas season. There are some good *Tomatoes* and *Grapes*. The *vineries* are being prepared for starting. *Cinerarias* look promising, and there are a nice lot. Out of doors all is trim and neat, and it may be hoped that ere long something definite may be known as to the future of this beautiful seat.—W. L.

**Annual Assembly of the Edinburgh Botanical Garden Staff.**

The members of the staff of the Royal Botanic Gardens, Edinburgh, held their second annual assembly in the Free Gardeners' Institute, Picardy Place, on Friday evening the 18th inst. Dancing commenced shortly after 9 p.m., when about thirty-two couples took the floor. During the evening selections on the piano were given by Miss Sinclair, and songs by the Misses Forbes and Stewart, and Mr. McArthur, which were all highly appreciated by the company. The masters of ceremonies, Messrs. Wilson and Gow, are to be highly complimented for their success in providing such an enjoyable evening, which was brought to a close in the usual way about 4.30 a.m. —N. McK.

**Croydon Horticultural Mutual Improvement Society.**

The last of the series of lectures arranged for this year was given at the society's rooms, Sunflower Temperance Hotel, on Tuesday, December 15, when, before a good attendance of members, Mr. J. Gregory, of Croydon, in a very descriptive and interesting manner, delivered a lecture on "Some Gardens I have Visited," illustrating it with lantern slides prepared by him from photographs taken by himself from time to time during his long career. Truly many of them reflected great credit to his endeavours as a photographer and slide maker. Mr. Gregory was one of the chief promoters of this society, and his energies, displayed at all times for the well-being of this excellent institution, are widely known.

**Covent Garden at the Christmas Season.**

Covent Garden is a great sight just now. Christmas fruit, flowers, and vegetables are present in a variety and abundance truly marvellous in these grey days, when not a bright patch of garden is to be found on this side of the English Channel. I picked my way to-day between scores of carts and waggons heaped with Holly, Mistletoe, and undressed Christmas trees, and snatched short conversations with burly men wrestling with barrels of Canadian Apples, boxes of Mexican Oranges, and hampers of nuts and fancy fruits. I gathered that the comparative failure of English-grown fruit had been more than balanced by an exceptionally good year abroad, and that Apples especially will be found to be plentiful and cheap. Mistletoe made a bad start, but is now coming in in large quantities, but there is a pronounced shortage in Holly. Nuts, moist and dried, show a falling off. Dessert fruit, which is all grown under glass, is, on the other hand, excellent in both quality and quantity. I think I have never seen finer Grapes than can be purchased just now, in "the Garden." —(From "Sheffield Telegraph," December 18.)

**The Proposed Gardeners' Association.**

A largely attended meeting of gardeners was held at the rooms of the Horticultural Club, London, on Tuesday, December 15, to discuss the proposal which many of our readers have been debating in these columns. Mr. Owen Thomas, V.M.H., occupied the chair, and Alex. Dean acted as secretary. Mr. Dean read a large number of letters all in favour of the proposition, but neither these nor the speakers at the meeting added anything to what has been said in the "J. of H." The suggestion to make an examination compulsory, is what we ourselves have said ought to be made law. Surely if gardeners were sifted into classes 1, 2, 3, according to their attainments and proficiency, it would be a step in the right direction. The association would appoint adjudicators, and practical work would be part of the test. Dr. Brown in his book "The Forester" set out an examination scheme for foresters twenty years ago, and the proposals he made are being gradually brought into practice to-day. There ought to be classes or grades of gardeners. In every line of life professional men require to hold certain certificates given by recognised authoritative corporate bodies ere they can obtain any appointment. Are gardeners to be the exception? Here is a means for raising the general status of gardeners, and of deterring the unambitious, narrow-minded, and thoughtless probationers. The meeting ultimately appointed a small committee, consisting of Mr. O. Thomas as chairman, Mr. A. Dean as hon. secretary, and Messrs. W. H. Divers, J. Willard, Jaques, Norman, Kelf, Dixon, and Allen to prepare a scheme as a basis for discussion, and bring up the same at a February meeting.

**The Suburban "Geranium."**

Certain suburban florists are by customers at this time of the year commissioned to lift Geraniums from beds, pot them, and keep them through the winter. The average floriculturist does nothing of the kind. He takes note of the varieties and their numbers, and then flings the old plants on the rubbish-heap. Say in May he sends to the customer Geraniums of his own raising in full leaf and flower. He is profusely thanked for his supposed services by the delighted client, who willingly pays treble value for the fostering care that has been taken with the plants throughout six dreary months!

**Value of a Holly Hedge near Newport, Mon.**

The value of a Holly hedge is no trifling matter, as was shown in the action of Williams v. Lewis heard recently at Newport. Mr. John Williams, a Newport provision merchant, of 30, Chepstow Road, had purchased an agricultural property at Pontyminster for about £3,000, alongside a portion of which there was a Holly hedge 15ft to 16ft high, 10ft thick, and forty to fifty years old. It was cut down by the defendant, Mr. Lewis, a farmer, who had a house adjoining, against whom £35 damages was claimed. The Holly was useful in protecting the site (upon which there was a proposal to build a sanatorium) from the north and the north-east winds. The defence was that the tenant of a cottage and garden on the plaintiff's property was aggrieved by the state of the hedge, as it allowed sheep to get on her garden, and she asked Mr. Lewis, the farmer, to cut it down. His Honour in the result gave judgment for £25 and costs.

**Orchard Planting in Gloucestershire.**

Recently, under the auspices of the Gloucestershire County Council, a demonstration on the planting of an orchard was given in a field adjoining Red Hill House, Lydney, by Mr. W. Iggulden, of Frome, Somersetshire. The arrangements were made by Mr. H. A. Howman, Director of Agriculture for the county authority named. The planting took place in an acre of red loam soil, close to the residence of Mr. Bathurst, jun., and which forms part of the Bathurst estate. Some 200 trees (all Apples) were set. Of these fifty were half-standards, and 130 dwarfs. One way the lines were 24ft apart, the other way 12ft, and the standards and dwarfs were planted alternately, the idea being that twenty years hence, when the dwarfs shall have passed their prime, they may be thinned out, leaving the standards in possession of 24ft of space all round. Afterwards Mr. Iggulden gave a demonstration on the pruning, grafting, and treatment of trees generally, in an orchard adjoining Lydney Park.

**Scholarships in Horticulture, University College, Reading.**

Four scholarships to young gardeners will be awarded in January, 1904. Each scholarship is of the value of £45 (inclusive of maintenance and instruction). The student gardeners holding the scholarships will be required to attend, from January to September, a course of instruction in the Horticultural Department and the garden of University College, Reading. Candidates must be of not more than twenty-two years of age, and must have worked for four years in public or private gardens. Applications for scholarships must be made on the scholarship form to be obtained from the Registrar. This form of application, accompanied by a certificate of work and character, must be sent to the Registrar before January 10. Candidates will be required to pass a simple examination in English, arithmetic, and the elements of horticulture. In awarding the scholarships, previous training and experience will be taken into account. The course of training will consist in:—1, Practical horticulture; 2, theory of horticulture; 3, account keeping; 4, lectures and practical work in botany and chemistry in relation to horticulture, insect and fungoid pests, bee-keeping. The scientific instruction will be given in the laboratories of the college; the practical instruction in horticulture in the college garden. The garden, 7½ acres in extent, is well provided with horticultural buildings. It contains, besides a large number of pits and frames, thirteen glass houses used for general florist and market work. The scholarship holders will be prepared for the R.H.S. examination. Certificates of proficiency will be awarded on the work done during the course, and on the results of an examination held at the end of the course. Apply to the Registrar, University College, Reading.

### Red Spider on Vines.

I quite agree with Mr. Jefferies as regards the fumigating of Muscat and Lady Downe's Vines with XL All, as to the utter impossibility of killing red spider without the total destruction of the foliage of the same—at least, my experience has been the same as Mr. Jefferies', and I am pleased to see the subject brought forward again, as it might be the means of causing some who have not tried it to be a little cautious before using it on these particular Vines. In the month of July I tried it in a house full of Muscats, with the exception of two Vines, one a Mrs. Pearson and the other Lady Hutt. The house is a lean-to, on the back wall of which are planted Peach trees, and at the time the Peaches were ripening and could not be syringed. Red spider began to make its appearance, and not wishing to let it get a hold on the Vines, I resolved (after being advised) to vapourise with XL All. The house was carefully measured, but not wanting to run any risks so early in the year, I used rather less liquid than the amount recommended, and glad I was that I did so, for on the second day after fumigating I could see the effects on the leaves of the Vines, though not to any great extent.

In the autumn the house was filled with Chrysanthemums on which were some green fly, and wishing to get rid of the fly, and at the same time try the effect of the nicotine on the Muscats, and not being so particular now, as the Vines were ripening their leaves, I again fumigated on two different nights; the first night a little under strength, but as a few green flies were alive the next day I fumigated again that night, according to the directions given. Next day, of course, the "flies" were all dead, the leaves of the Muscats pretty well burned up, and the red spider still living! I might mention that the foliage of Mrs. Pearson and Lady Hutt were not affected in the least.

Now, let it be understood that I by no means wish these few remarks to be a stumblingblock to the use of XL All; rather on the contrary. I can highly recommend it, having used it for a number of years, although never on Muscats or Lady Downe's, but in another viney of mixed Grapes without any bad effects; also for Peach trees, foliage plants, &c., with grand results, to the total destruction of thrip and green fly, but not to the extermination of red spider.—JAMES DUFF, Threave Gardens, Castle Douglas, N.B.

### The Raid Against Show Boards.

I have attended a good number of provincial Chrysanthemum shows, but the most artistic display was seen at the last Cardiff Show. This society boldly abolished their class for 24 "Japs," distinct, substituting a class for eight vases, each containing three blooms of one variety, and instead of flowers of one variety shown on boards, they had classes for five blooms of one variety shown with their own foliage in a vase. The experiment was a pronounced success from every point of view. The reason why vase classes have not been a success at some exhibitions arises, I have no doubt, from the ambiguous wording of the schedules, and the lack of proper knowledge on the part of the exhibitors as to the best method of staging. If good prize money is offered, exhibitors will be found willing to compete for it; and of this I am convinced, that instead of lessening the number, it will eventually have the opposite effect. For under the old system blooms that have been shown upon boards are useless after a show; whereas blooms that have been shown in vases may be taken home and utilised for house decoration. And what employer would not be proud of his gardener's handiwork if he were able to show to his friends the exhibit that had won the first prize, or even the challenge cup at some good show, and by so doing stimulate the spirit of rivalry amongst neighbours; thus ensuring better competition for another year? I have not seen the Edinburgh Show, but understand it is the most successful in the country, and evidently the experiment of abolishing boards has not spelt disaster in this case. More attention may be paid to blooms staged on show boards by gardeners and growers, but not by the general public; and it is the latter who chiefly sustain our shows by subscribing and paying the entrance charges. I think Mr. Dean's fears about the extinction of a large number of exhibitors are quite groundless.—A. H.

I was glad to see by the remarks of Mr. Richard Dean, page 534, that he is fully alive to the necessity of retaining show boards for exhibiting blooms of Chrysanthemums. I think there is room, and with advantage too, for vases and boards. Com-

petition would be less keen if show boards were abolished. I, too, think that the writers of the various articles against show boards little dream of the expense in providing, carting, packing, and storing vases, that societies would be put to if all blooms had to be shown in vases alone. Then, again, what huge boxes are required to take blooms, on long stems, to shows! To take three dozen blooms, it requires a box 5ft 6in long, 2ft 6in wide, and 2ft 3in in depth. "Small panttechnicons," one exhibitor aptly described his boxes! The cost is very great in getting to and from the shows with these huge boxes. There are excess fares to be paid, and "tipping" to be done at all stations. The Crystal Palace is a most awkward place to get at; at least, when one is loaded with these travelling boxes.

It was with feelings of dismay that I heard our president (Mr. C. E. Shea) announce that the Horticultural Hall, which is now being built, would be too small to hold the N.C.S. shows. Could not some of the leading gentlemen of the R.H.S. have approached Mr. Andrew Carnegie, who so kindly provides free libraries for the asking, and prevailed on him to give a sum sufficient to have chosen a larger site for a larger hall, so that all the different societies could have found refuge under the wing of the R.H.S.?—A. JEFFERIES, Moor Hall Gardens, Essex.

[Mr. Carnegie was earnestly appealed to, by influential gentlemen.—Ed.]

### Chrysanthemum Critique Controverted.

Reviewing the remarks under the heading "Successful Varieties of Chrysanthemums," page 532 ("J. of H.," Dec. 10), I find "Sadoc" describes Mrs. T. W. Pockett as a sport from Nellie Pockett. This is quite wrong, as it is one of Mr. Pockett's Australian seedlings, and was sent out by Mr. W. Wells of Earlswood Nurseries in the spring of 1902. Cheltoni is the only sport that I know of coming from Nellie Pockett, and this was sent out by Mr. Wells last year. Then again on page 533 "Sadoc" is in error in his selection of what he describes as true Japanese incurveds. He classes Mrs. T. W. Pockett as an incurved "Jap," and of "rich yellow colour." Blooms that I have grown of this variety have been canary yellow, and as good a type of Japanese bloom as Viviani Morel when seen at its best on the exhibition boards a few years ago, and every petal, from start to finish, reflexes. Calvat's Sun is a grand variety, but it does not meet my ideal of an incurved "Jap." The same remark applies to Godfrey's King. "Sadoc" would make a poor authority to look to if he classes Mrs. T. W. Pockett (a true Japanese), Calvat's Sun, and Godfrey's King as belonging to the section known as Japanese incurveds. Madame Waldeck Rousseau rightly belongs to this section, but a more wretched colour in a Chrysanthemum I have never seen. I have grown it this season for the first and last time.

Returning to page 532, under the heading, "Non-successful Varieties," I agree with "Sadoc" that W. R. Church has not been seen at its best this season, but the distinct green tip which he complains of is quite natural, and very pretty; in fact, quite charms me. Mrs. Barkley with me has been extra fine this year, both in size, form, and colour, so that I cannot let this variety pass as a failure. Again, Godfrey's Pride is described by "Sadoc" as too small. Blooms I have grown and seen staged are quite up to exhibition size, and I will be greatly surprised if it does not stand in a good position in the Chrysanthemum analysis which Mr. E. Molyneux has again kindly undertaken to prepare for the benefit of Journal readers. Exmouth Rival is the grandest dark coloured "Mum" I have seen; no up-to-date grower should be without it. One of the blooms staged by Mr. Godfrey at the N.C.S. November Show, at the Crystal Palace, was fully up to exhibition size. And blooms such as this would be most acceptable in stiff competition in a class of 24 Japanese, distinct. Guy Hamilton was shown at Birmingham 8in and 9in in depth—so one of the judges informed me—which disposes of "Sadoc's" assertion.

This season Mr. R. Kenyon, of Woodford Green, had a fine lot of Madame Herwege. The plants were about 8ft high, and each carrying three blooms, almost as large as those of good Madame Carnots. They were magnificent results from skilful culture. Mons. L. Remy has not been shown much this year, but last year it was shown at nearly every show in the kingdom. It is early to class this sort among the derelicts. Lily Mountford, I must admit, loses its pretty rose colour and becomes "washy," but that is after it has been in bloom a fortnight; but so do many others of less merit, and in less time than this variety. Alfriston, as shown by Mr. W. Mease in the first prize 48 Japanese at the Crystal Palace in November, certainly appeared to beat that grand old warrior Edwin Molyneux in form and size, but not in colour, though in the latter it is almost identical. There is room still for the old favourite when well grown.

Lastly, Mr. "Sadoc," I should like to say that J. R. Upton is, with me, one of the best. The blooms are of huge size, grand form, and excellent in colour. A vase of 6 blooms won for me a great victory over huge blooms of F. S. Vallis at the N.C.S. Show in November. Mr. Charles Beckett also had J. R. Upton magnificently staged in one of the 12 vases he staged in the Great Vase

Class. Lady Cranston, the white sport from Mrs. Barkley, is the gem of this year, and is one of the most lovely flowers I have ever seen.—A. JEFFERIES, Moor Hall Gardens, Essex.

I never felt more relieved in my life than I did this morning (Friday, December 18) when reading the letters from R. Barnes and "A. H." on page 561. Since reading "Sadoc's" letter of the week previous I felt sort of "mixed up." I wondered if it was "Sadoc," or myself, or the "Mums" he named that had gone wrong, because I have taken particular notice of the best varieties from west to east, and from south to north this year, for a very special purpose. Most of those which "Sadoc" mentions as being in a decline I find, on referring to my notes, have been in the very best form. And I find that I have given many of those declining varieties a position amongst the best 24 Japs in existence. The "proof" has reached me from the printers, and I could not find courage to alter the position I had given them; neither did I, in spite of "Sadoc's" article. Therefore this morning's "J. of H." took quite a big doubt off my mind, this being, Which of the three was wrong? It appears it could not have been me, or the "Mums."—W. WELLS, Earlswood.

I am not surprised to find my remarks on page 532 taken exception to by what I term sentimentalists showing a weakness for particular varieties that have been great favourites in the past. I did not criticise the varieties without due regard to facts, as I have had abundant opportunities to see the blooms presented under varying circumstances of locality, probably rather more than either of my critics. The "less inexperienced readers," I am sure, will welcome Mr. R. Barnes as their champion to look after the interests they are unable to perform. Let us see what are the actual facts of the difference of opinion between us all. In the first place I did make a mistake in describing Mrs. T. W. Pockett as a sport; it is one of Mr. Pockett's best Australian seedlings. Perhaps Mr. Barnes has seen one late bloom of Lily Mountford with sufficient colour tint to make it attractive, whereas I have seen scores, and not one of them anything equal to what it was when first introduced. J. R. Upton, now, is generally the palest of yellow instead of that rich golden yellow which was its charm. Mrs. Barkley has been most "washy" in its colouring, which denotes weakness in constitution; the florets, too, are flabby and badly formed.

Florence Molyneux has lost size of bloom, and that whirl of floret that was its great characteristic, in spite of many attempts "to grow it properly." Perhaps Mr. Barnes will supply the remedy in that respect, and also how to get rid of the green tinge that has so persistently characterised W. R. Church this season. I note Mr. Barnes has a qualm about Mrs. J. Lewis, M. Louis Remy, and Le Grand Dragon. He says: "Given a better season, there is no reason why they may not be as good as ever." He will find something more is wanted to elongate the petals to their former length. T. Carrington and Australie have been often shown, but how? Why, without that perfect curl and density of petal that was their great charm. The change in them now so palpable is the stepping-stone to oblivion! Madame Cadbury has lost breadth and length of floret. I do not connect Lady Ridgeway with the hairy section as Mr. Barnes assumes. Ah! Mr. Barnes, I was told years ago "never to assume anything." If Duchess of Sutherland does not belong to the incurving Japanese section, to what does it belong?

I will now turn to "A. H.," who is no doubt an enthusiast possibly with a limited scope of practical observation, although from his own showing he is a deep reader of reports. The fact of W. R. Church being staged so many times does not improve its individual quality. The reports of shows and classes, which are now numerous, must be made up with some varieties. If none but those that are staged in the best condition were eligible, how could we get competition? Where one bloom of W. R. Church had the "green tips" when it first came to light, hundreds have it now. I have a hazy recollection of complaints being made that this variety then showed too much colour for some (those who could not produce it). What cause is there now for the change? I would ask. Harking back in a sentimental way will not win prizes. Replacing those varieties that have done good service by their superiors is the way to do this. Sentimentalists are only notorious in that one line. The rage at the present time is forward, no time for looking back; there are plenty to do that! He that wins hesitates not.

The fact of Guy Hamilton and L. Mountford winning certificates for premier blooms is not a proof of their excellence, but rather a weakness in their opponents. Perhaps "A. H." will tell us how to produce Mrs. J. Lewis in such a manner as to class it as one of the best whites. Does he say the Cardiff blooms were equal to those staged at the N.C.S. November Show two seasons ago? I do not doubt for one moment that many varieties I point to as having had their day will be found well up in the next analysis. How can a list of fifty varieties

be made up without them? I would ask. That even is no proof the blooms will be seen in the finest condition next year.—SADOC.

### The Proposed Gardeners' Association.

Two very interesting letters on the above project appear on page 536, the first from a no less authority than Mr. F. W. Burbidge, and the second from "W. B.," who is evidently a man of careful thought. Mr. Burbidge is evidently in favour of the association; but "W. B." asks pointed questions. Like a good many other people, he does not appear to be quite clear what the objects of the proposed association are, and how it is going to benefit gardeners generally, either financially or socially. Of course, the promoters of the idea may see further, but it is quite evident that the task before them is beset with difficulties. I quite agree with "W. B." that the association, if formed, must not be in any way antagonistic to employers. In fact, it must have no suspicion of being a trade union, nor must it attempt to dictate to employers, owing to the peculiarity of the gardener's position.

I quite think that the intelligence and general bearing of the average gardener are sufficient to place him above the ordinary run of domestic servants; but he is a luxury nevertheless. Even the meanest employé in a factory or workshop is so much a part of the concern that he has a claim on it, and his employer cannot do without him if he is to make money out of his business, hence the power of labour union. But the gardener's case is different altogether, as he caters for the pleasure, and not the pocket [?] of his employer, and is, therefore, dispensable. Again, there are so many grades of gardeners, that even the definition of the word is not clear. In short, the gardening door is always wide open, and if anyone who potters about for a year or two in a horticultural establishment likes to style himself a full fledged gardener, who is to say him nay? One question, therefore, is whether the association will establish grades of gardeners, and how will the distinctions be made? It seems possible, even probable, that the association, if formed, may do good and be of some help to gardeners; but I am afraid that there is not much hope unless it is founded on lines that are not in any way distasteful to the majority of employers. A union of colliers or bricklayers may demand certain terms, but a union of gardeners must ask for them, and be extremely careful also how the request is put.—H.

It is truly gratifying to see that an idea which has occupied the minds of many intelligent gardeners is on the eve of becoming an accomplished fact. In all the debates upon the subject which I have heard, most emphasis was always placed upon the important question of finding situations. In Scotland, some twenty or twenty-five years ago, the glut of gardeners was very much out of proportion to the demand, and consequently places were less easily acquired. After the great calamity to the country caused by the City of Glasgow Bank failure, the outlook was indeed anything but bright for the gardener, in whatever sphere he laboured. If a journeyman, and he failed to get suited on the "Term Day," he had to divide his chances of getting reinstated in the spring, between the precarious employment and pay afforded by the nursery (and even that was welcome to many a young fellow) and the length of time his necessarily small savings would help him to eke out an existence in lodgings in the Metropolis. Foremen's chances were very much less, and as for head situations they are perhaps always scarce, but about this period such were only got with difficulty. The writer experienced his share of this depression, though never disemployed since he began.

I saw then that there was room for a better arrangement of the employment of gardeners by the formation of a huge corporate body such as that now aimed at, but slightly more elaborate, inasmuch as to include all regular gardeners; that is, everyone who served a full apprenticeship. I fail to see the workable nature of the new scheme, or its use, if it does not include journeymen, for is not their share in the success of such an undertaking as important from both sides of the question as that of foremen and heads?

Another very important thing in connection with this matter is the necessity for a circulating library to contain books, ancient and modern, that have a bearing upon gardening. In most horticultural associations this is a premissory condition of the rules, but seldom ever executed. I have often urged this necessity upon some of the most prominent members of the Scottish Horticultural Association. By arrangement, books could be circulated from the central library to all other minor associations throughout the land, thus bringing all books, otherwise impossible of access, within the reach of all. Lastly, every attempt shall, I hope, be made to keep any form of trade unionism in the background, for as every sensible man knows, such coercive measures would only meet with misuccess, which they would deserve. Therefore, all that could be aimed at is simply to raise the profession, in a certain measure, out of the depths into which it has fallen through the ingress of irregular professors, and generally raise the standard of the regular practitioners' intellect.—D. C.

### Executive Committee of the N.C.S.

A largely attended meeting of the executive committee was held at Carr's Restaurant, 265, Strand, on the 14th inst., Mr. Thomas Bevan presiding. The minutes of the last meeting having been read, the secretary reported that the president, Mr. Charles E. Shea, had generously promised to renew his special prizes at the November Show in 1904. The prize money awarded at the December Show was announced to be £32 13s., the secretary stating that several who had entered were unable to exhibit owing to the rapid fading of their flowers consequent upon the damp weather. An interim financial statement was submitted, showing a balance in hand at the bank, after paying the December prize money, of £160 6s. 1d. To this was supplemented a statement that cheques had that evening been drawn for £102 14s. 1d., leaving a balance of £57 12s.; that realisable assets might reasonably be put at £65; the outgoings to the end of the year, about £45; so there was every probability of a satisfactory surplus at the end of the year.

The chairman reported the officers had waited upon the general manager of the Crystal Palace Company, and they had suggested some increase in the amount given by the Company for the November Show, and he had every reason to believe there would be a favourable response; also that it was practically understood there would be no other exhibition held in connection with the November Show in 1904. It was resolved that in addition to the November Show next year there should be the usual early exhibition on October 4 and 5, and a late show on December 8 and 9.

The secretary stated that by way of adding to the interest of the November exhibition, some members of the committee and others had promised special prizes of five shillings for the best individual blooms of certain varieties of Chrysanthemums they named, to be selected from the whole show, and that he had reason to believe some sixty of these prizes at least would be forthcoming. Several members of the committee present signified their wish also to give prizes for varieties they named. The details would be considered by the schedule revision sub-committee, who would make recommendations to the executive committee.

He further stated that an old and liberal supporter of the society had offered the sum of five guineas towards an evening exhibition of the best later-flowering market varieties, to be held near Covent Garden either just before or just after Christmas, 1904. The main object sought would be to ascertain the best varieties for producing the best effects under artificial light. It was believed market growers and salesmen would become interested in the experiments, and give it substantial support. The secretary will report progress at the next meeting of the committee.

The annual audit of blooms at the November Show in the competitive collections was submitted by the treasurer, Mr. A. Taylor, all bunches being set down as individual blooms. From this statement it appeared that 1,764 blooms had been staged, against 2,544 in 1902, and 3,378 in 1901, the decrease in the present year being largely attributable to the incidence of the weather. A division of the blooms into their several classes showed: Japanese, 1,086; incurved, 444; reflexed, 24; large Anemone flowered, 132; Anemone pompons (bunches), 12; pompons (bunches), 48; singles (bunches), 18. The greatest falling off was in the Japanese blooms; several exhibitors who entered at the November Show failing to appear from decay of their flowers. Ten new members were elected, and the Darlington Horticultural Society was admitted to affiliation. The proceedings closed with a vote of thanks to the chairman.

### Rust on Chrysanthemums.

Though the rust has not been anything like so rampant as in some past years, there is not that immunity one would wish. We found that not until quite late in the season did it spread from leaf to leaf, and in very many then, it defoliated the plants as in past seasons: and there were far too much for a healthful advance of the blooms in every case. One firm of nurserymen has this year expelled entirely their stock of Chrysanthemums because rust was so virulent as to make their cultivation profitless. They elect to buy rather than grow, for their florists' work, and in which they have an extensive output. To them this must be a matter of serious moment, and

the step taken is one that would not suggest itself except under such extraordinary misfortune.

The dying out of the infection was a subject of slight discussion last year in the Journal pages, and the editor would, I feel sure, welcome any further comment calculated to assuage the dreaded fear in this dire affliction. A problem that seems difficult of elucidation is, Why should one's neighbour, only a short journey distant, be absolutely free from infestation, while one's own continue under the baneful influence of the rust spores? Diseases one would naturally expect to be more rampant in a year of rain and absent sunshine than in a more normal one, but the fates seem, so far as I can gather, to have decreed it otherwise. But even this small speck of consolation scarcely justifies the hope that the near future portends immunity almost, or quite wholly, as affecting the market plant or the specimen bloom.—R. A.

### Novelties.

#### SINGLE-FLOWERED VARIETIES.

Captain Allsop is a finely formed flower, rich yellow in colour. Mrs. G. W. Forbes has flowers fully 5in in diameter, of a rich purple maroon colour. Felix, terra-cotta, very attractive. Starlight, pure white with pointed petals, very free.

Pretoria, yellow. The florets are wide apart, very attractive. Sir G. Bullough, rich yellow. Annie Farin, dark red. Horatia, terra-cotta base, gold tips. Mrs. C. Symus is best described as a rose coloured Mary Anderson.

The Bride, pure white, with a curl at the tips of each petal, fully 6in in diameter. Elsie Neville, crimson terra-cotta. Kate Williams, rich yellow. Miss F. Wilcox, white flushed pink with a most charming disc.

Mrs. T. C. Warden, pure white. Mrs. E. Roberts, pale pink. Mrs. R. M. Parkins, clear yellow. Glorious, a large Japanese variety, rose colour, base of petals white. Kathleen Pestifield, deep rose, with a white ring at the base.

The Queen, Japanese type, with twisted petals, crimson red. Chibran's 20th Century, golden bronze, shaded yellow. Kate Williams, golden yellow, florets twisted. Ladysmith, pink, very free. Mary Paul, a soft Malmaison colour, passing to white.

Mrs. R. J. Lockhart, dark crimson, with yellow disc and tips of florets. Nora, soft pink, with a pure white zone around the disc. Star of Honour, pure white, with a cream centre.

#### INCURVED VARIETIES.

Mildred Lyne is a sport from the well known Mrs. H. J. Jones. The colour, gold, striped and suffused with rose, a distinctly promising variety.

Embleme Portevine has flowers fully 5in in diameter. The florets are short, very thickly set. The colour is rich orange yellow. Mr. F. King is soft pink in colour, with long narrow petals, closely incurving.

M. L. de Lebusquette, crimson colour on surface, with chestnut reverse, a closely incurving variety.

#### DECORATIVE VARIETIES.

Madame Emilien Jolivet is an improved Mdle. Melanie Fabre, rose pink, edged with purple. Pride of Keston is a small flowered Japanese variety, violet purple in colour, very dwarf and free. Searlet Prince, a free flowering bright red Japanese. Indian Chief, rich red.—E. MOLYNEUX.

## Modern Progress in Horticulture.\*

(Concluded from page 556.)

One of the most potent aids to progress in horticulture is travel. We must all go to gardens, nurseries, or exhibitions both at home and especially abroad to obtain new ideas and methods and to see what our competitors are doing. The decorative plant cultures of Bruges, Ghent, Brussels, the bulbs at Leiden or Haarlem, the shrubs and trees at Boskoop, are only a few of the object lessons in commercial gardening our own growers ought to see for themselves. Even so it seems to be still a case of demand exceeding supplies, or an excess of population over the present cultivation and produce of the land. As things are at present there seems ample room for progress in the shape of more good market gardening, despite the fact that other countries may possess natural advantages, such as a better climate, State aid and instruction, cheaper land and labour; and last, but not least, better co-operative information bureaux and cheaper transit charges as well. English market gardeners are often too exclusive and independent: they fight shy of co-operation as a rule, and so they are practically at the mercy of the big carriers, whether by rail or otherwise.

One very patent sign of progress nowadays consists in the specialisation going on, especially in trade or market gardening. Some, indeed many, of our best cultivators are specialists

\* A paper read before the Horticultural Club, London, by F. W. Burbidge, M.A., V.M.H. Printed in Journal of the Royal Horticultural Society.

in the best sense of the word. It is easier and cheaper to grow a house full of one thing than a house full of many things. One man becomes famous for Grapes or Peaches, and another for Rhubarb and Seakale, or Asparagus, or even Mushrooms; another grower takes up Carnations or Roses, Palms, or Ferns; and we have even specialists devoted to Lily of the Valley who can supply flowers of it practically every day in the year. We have Tomato, Potato, Sweet Pea, and Daffodil specialists, and these men are bound to surpass growers who divide their capital and attention amongst too many separate things. The word specialist spells progress. The planting of groups or masses of one good plant, or shrub, or tree, instead of the old method of dotting about single plants of almost everything, is one of the most radical and far-reaching of all modern methods in gardens.

In fruit-growing the same principle is going on, and instead of an orchard of fifty or a hundred trees, all different, we have perhaps ten to 500 trees of a kind, and only the best and most useful or profitable kinds or sorts are grown. The mixed-muddle orchard or fruit-garden has gone the way of the mixed-muddle shrubbery and plant-houses, and so far there certainly have been progress and improvement also during recent years. There have been revivals, too, in the garden; sundials and quaint old urns of lead or stone are being introduced to many brand-new gardens—"old wine in new bottles"—and not always of good taste or right proportion. Instead of the old moats for protection, and fish or stew ponds for food on fast days, we have Water Lily pools or tanks and canals, and we have borrowed the old gazebo or pergola from Italy, not for our Grape vines, but for Honeysuckle, Clematis, and rambling or climbing Roses. Hedges of clipped Holly, Box, Yew, or Cypress are being again used for shelter in places of walls, and I may add that Levens and Elvaston must look to their Laurels or other old formal trees, for there is a marked revival in the shape of corkscrew-twisted and poodle-clipped evergreens.

Even in garden literature there is progress, thanks in the main to photography and process blocks—and, may I add competition?—since we now have a baker's dozen of weekly (and "weakly") gardening newspapers where we formerly had only two or three. There are, or are to be, revivals in our craft literature also. For some years all the nice old gardening monthly magazines with coloured plates (if we except the "Botanical Magazine") have been dead and almost forgotten, but a revival has taken place in the shape of "Flora and Sylva" which Mr. W. Robinson has recently taken in hand. I may be allowed to say that with all our many horticultural papers there appears to me room for at least one more. None of us can read everything of interest now published in the numerous papers and books devoted to gardening in all its many phases, and I think there is ample room or scope for a weekly digest and index of all they contain. Such a paper, or let us say horticultural register, well done and of a convenient size for binding would be a great boon to us all.

New methods are few only, but of great economic importance. Chief amongst them perhaps is the "retarding" process, or freezing apparatus, by which many hardy shrubs, plants, bulbs, vegetables, and flowers may be held inanimate for months and then brought to perfection at will. In this way we get Lilac and Lilies and other things any day in the year, or just when we require them. The use of ether, again, assists materially in the process of forcing or acceleration, and the electric light may on emergency be pressed into our service to the same end.

These scientific resources of civilisation have already worked wonders as practically applied by trade growers, and it would appear that time and season will be done away with, and it will be possible to have many choice garden products in the market and on our tables any or every day in the year. We must look also for new legislation on the important question of diseases (fungoid or otherwise), insects, and weeds in gardens and fields alike. Sir James Rankin, M.P., has already a Bill in the House of Commons, which has passed the first reading, "with a view to the eradication of disease and insects from amongst fruit trees, &c., in nursery gardens." This will mean some quarantine regulations and inspection of imported stocks, seeds, &c., and may lead to a pathological section being added to the existing machinery of the Department of Agriculture; in a word, it is becoming as serious to harbour diseased or insect-infected plants as it is to keep diseased animals.

In considering horticultural progress the Royal Horticultural Society may be taken as an index, or let us say as a barometer, showing the high pressure and popularity of gardening in England. We need scarcely ask whether garden craft is spreading when the fellowships of our premier Society are increasing by a thousand or more year by year. Then the Royal Botanic Society is also progressing and doing good work, though perhaps along slightly different lines. To put the difference of method, one may say that the R.H.S. teaches gardening as associated with botany, while the R.B.S. teaches botany as associated with gardening. It is tweedledum v. tweedledee, and the result is a loss of force and to some extent a needless competition, and it is a matter of regret that the two societies cannot co-operate for the public good. Local societies we must have, and very useful work is done by them; but even these are all the more useful

if federated with the central authority and prestige of the R.H.S. of England. On all sides we see evidence of combination and co-operation in the farming world and in other forms of productive and distributing commerce, but gardeners as a body hold aloof from organised association, as some of us think, to their own loss both individually and collectively.

In these concluding lines I sum up my present argument as this, That method and skill in the best private gardens are up to a very high state of excellence, but that the most economical production and the largest and best crops—I do not say of the best varieties in all cases—are to-day produced in our concentrated trade or market gardens. I also may suggest that no finer produce is grown in private gardens now than was grown fifty years ago, either in the shape of fruit, vegetables, or flowers, despite the influx of new and improved varieties. The old records now beaten are but few.

I am no politician or prophet; I merely note the signs of the times; and I hope I have shown, or at least suggested, that gardening, formerly aristocratic, conservative, and secretive, is now democratic, more generally diffused, and more liberal, and that as an art or craft it is open to peer and peasant alike; open to "all sorts and conditions of men," open as is the sunshine or the light of day.

## Gadding and Gathering.

Notes from Kew.

*Cestrum aurantiacum* furnishes masses of its golden, trumpet-shaped flowers, and what we took to be *Dahlia imperialis* (though like many other things at Kew, it was not named) was flowering at the apex of its succulent stems, 10ft high. The blossoms are single, and pale mauve colour.

An interesting plant is *Dermatobotrys Saundersiae*, with bright crimson, tubular flowers (5-cleft perianth) in verticillates of twelve. These are borne at the ends of the half-ripened shoots which are not unlike the woody stems of *Hydrangea Hortensia*. It comes from Natal. The flowers are over 2in long, and are narrow. *Cytisus filipes* is a white Broom, now in flower.

*Libocedrus macrolepis* with flattened imbricate leaves, in a general way resembling *Thujaopsis dolabrata*, but of a darker green and much flatter in structure, is represented by a bushy plant in a 10in pot in the Temperate House. It is about 3½ft high. The label bears the record "Veitch, '01," which would seem to indicate that it is a novelty introduced by the Chelsea firm. While naming Conifers, attention might be drawn to another splendidly ornamental subject—*Cupressus funebris glauca*. It grows very fast, for a specimen in the Himalayan division of the Temperate House at Kew has attained a height of about 20ft in four or five years. The branchlets are "weeping" in character, and the colour is slaty-blue, otherwise called glaucous. It is very distinctive and graceful.

To the list of plants in flower in the greenhouse which I gave recently, there should be added Roman Hyacinths, Yellow Pottebakker Tulips, *Tibouchina macrantha*, *Chironia linoides*, *Tecoma Smithi* and *Browallia demissa*.

### Ivies.

Ivy English Ivy, perhaps the most typical plant or climber that adorns Old England. People away far across the ocean, in sunny colonial homes, when thinking of the Mother Country must picture in their minds the old half tumbledown outhouses standing by the pretty cottages, and the outhouses are always loaded with Ivy. Or it may be the walls over the bridge that spans the stream in which they were wont to wade and "guddle" for trouts or other fishes in the days of their childhood. Ivy! English Ivy! Thousands of Ivy plants are inserted in the ground every autumn, winter and spring (summer as well, we might as well say), but, alack! it is mostly *Irish* Ivy that is planted. Nevertheless, "Irish" Ivy is "English" Ivy too; and that makes a bull! When visiting the nurseries of Messrs. Wm. Paul and Son at Waltham Cross some little while back I noted the names of those Ivies that are most commonly sold, and which can be procured from good nursery firms everywhere. There was the Irish Ivy and its silver-leaved form; *amurensis* and *dentatus*, both large leaved forms. At Kew the largest leaved *Hedera* (Ivy) is one they call *grandifolia*, size about 5in deep (or more) by 4in wide at the top. *Hedera Helix* (which is the botanical name of the Ivy variety, *atro-purpurea*, has moderate sized purplish leaves. *Aurea spectabilis* is yellowish, and recommended for walls, the same as *Algeriensis*, which I always think is one of the most neglected wall plants the British gardener deals with. It is very hardy, and is so cheering, neat, clean, and pretty. *Walthamensis* is a particularly neat and useful variety of the English Ivy. Lastly, I would name Emerald Green, which has somewhat rounded leaves; that is, it is about as broad as long, 3in either way, and of a brighter green than most Ivies. For root-stumps, banks, rough coverings, it is very beautiful and commendable.—WANDERING WILLIE.

#### ***Aphelandra nitens.***

A stove plant, which, were it only for the intense claret colour of its elliptic-ovate leaves, is deserving of popularity; but in addition to them the erect stem is terminated by a dense bracteate spike of scarlet flowers. Grown annually, says a contemporary, from cuttings in small pots, it forms a useful, highly decorative plant, very effective when intermingled with lighter coloured subjects as an edging for stages.

#### ***Freesias.***

The best locations for these after housing, is on shelves well up on the light, observes "American Gardening." They are now making satisfactory growth, and some supports must soon be given. Sometimes their brush is used; other growers stake each shoot separately—a big task where thousands are grown. A good plan is to cut some rather coarse mesh wire netting the size and shape of the flats or pans, and support the same by a couple of sticks at each end of the flats, or three or four sticks round the pans. Let the netting be suspended directly over the plants at the height of, say, six inches for the first piece, and as the plants grow fasten another piece about eight inches higher; this will be found to support the plants nicely, and no trouble will be found in cutting and pulling the spikes through the netting. These pieces of netting, once cut to the required size, can be used each successive year. As flower spikes show some liquid manure can be given. Do not give it too strong, or the leaves will quickly show brown ends. As these plants will not stand heavy smoke, care must be exercised in fumigation.

#### **Improving the Soil.**

The difference between cultivated and uncultivated ground is most marked, and is readily apparent to even the most uninitiated when the results are seen in the produce derived from both, especially with kitchen garden crops. One of the best methods of improving soil is trenching. This process breaks up the ground to a considerable depth, and in time the beneficial action of air and moisture pulverises, ameliorates, and enriches the soil to such an extent that the roots of crops can not only easily permeate the improved medium, but readily abstract supplies of food. Although trenching is excellent, and proves to be serviceable sooner or later, yet there are times when it may prove misleading, and the results which follow not at all satisfactory. This, probably, is owing to the fact that in the process of trenching good soil has been buried and indifferent subsoil brought to the surface; in fact, the layers of soil have been reversed. Time will rectify this, but it usually happens that a crop must be grown on the land immediately after. Land that has not previously been trenched is the worst in this matter, therefore the best way to act is to adopt the process known as bastard trenching, which consists of keeping the soil in its original position, but deepening it all the same.

Improvement by trenching can be applied to all kinds of soils, light as well as heavy; but special methods must also be adopted to modify the effects of some particular class of soil. For instance, sandy soil is often too hot and dry for the best results in cultivation, hence the addition of some loam of a clayey character, which may be pounded and spread on the surface, afterwards digging it in when pulverised by frost. Manure of a cooling character such as cow manure should be added to such soil. Chalk may also be added with advantage, or a little lime. A clay soil, on the other hand, is usually so very tenacious that a dressing of lime will help greatly in breaking it down; but very stiff and obstinate clays indeed cannot be improved quickly except by burning, which will cause it to crumble. The addition of sandy loam, road scrapings, or other gritty material will greatly improve ordinary clayey soils. In turning up stiff soils for the winter, leave the surface very rough so that the action of frost may have free play. It is a good plan to form it into ridges, whereby a larger surface of soil is more completely exposed.—E. D. S.

#### **The Poplar Tree, Popular.**

It is not generally known that there is now a great demand for the Poplar tree. Since the introduction of trams, hundreds of these stately and ornamental trees in Sussex have been felled and cut up into small blocks to be used in conjunction with the brakes on electric trams. They are used extensively on the trams in Brighton, and so effectual are they that the authorities do not care about utilising a different kind of wood, though, as is generally known, the Poplar was not, at one time, looked upon as being of much worth, from a commercial standpoint. There are not many of these trees in the county now, and the supply of the blocks will soon be insufficient to meet the demand, if such is not the case already.

#### ***Ficus diversifolia.***

The smaller species of *Ficus* are not much cultivated in ordinary gardens, but some of them are suitable for growing as a variety from the monotony so frequently seen in greenhouses and conservatories. There is a pretty little *Ficus* in the Glasgow Botanic Gardens, called *F. diversifolia*, which is worth growing for the stage among flowering plants. It is of quite compact and bushy growth, the specimens at Glasgow being only some two feet or so in height. The small leaves are pale green beneath, and bright green, dotted with small brown specks, above. They are narrowed to the base, but rounded at the apex, and leathery in substance. It thrives well under greenhouse treatment. The small fruits add to the interest of the plant.—SOL.

#### **Harmful effects of *Humea elegans*.**

In the struggle for botanical existence one plant will crush out a weaker fellow by depriving it of light or air, by throttling it or starving it; but while all these, and many other methods, are familiar to the evolutionist, it has not been generally known that one plant may poison another. An apparent instance has, however, lately been noticed in the plant called *Humea elegans*, which exhales a powerful odour like Russia leather. It was found that when placed in a greenhouse near a Peach tree a comparative burning or withering of the young Peach leaves in its neighbourhood was the result. It did not inhabit the same soil as the Peach, but even when some distance from it seemed able to exercise a harmful effect, which at last resulted in stripping the Peach of all its young leaves.

#### ***Galtonia candicans.***

This noble Liliaceous plant should require no formal introduction to any professional gardener, yet we bring it forward now, when new beds, borders, and shrubberies are being made, in the hope that even more plants of such a beautiful subject may find a station in erstwhile vacant places. Placed in beds along with *Tritomas* or any scarlet or crimson-flowering outdoor plant, whose display is made during August and September, the *Galtonia* furnishes a splendid contrast. The illustration on the opposite page shows a natural size inflorescence, and the spotless white bells all droop, as shown. The strong, fleshy stalks rise upright from the succulent foliage, a yard or 4ft high. The bulbs delight in a deep sandy loam, with which is incorporated leaf mould, or similar humic material. Once in place, they need not be disturbed for three or four years. The present time is suitable for planting. Sometimes the plant is cultivated in pots, and flowered in the open air. They are thus useable on formal fronts and forecourts. For protection to the planted-out bulbs in winter, cover the crowns with flaky leaf mould.

#### **The Grassy Transvaal.**

The Grasses are the most conspicuous feature of the Transvaal flora, at least in the high veldt. Succulents are practically confined to rocky kopjes and randjes (ridges). Bulb and corn-producing plants abound among the Grasses. Trees and shrubs are scarce, as a rule, but evergreen *Proteas* and other bushes or small trees occur on kopjes and randjes, and there are dwarf woods near water. In the moist veldt Grasses are eight or ten feet high. About 50 genera and 130 species of Grasses are known to science in the Transvaal. Of the genera as many as 44 are seemingly indigenous, a fact accountable to the isolation of the country, and unlikely to continue much longer. *Andropogons* and *Anthistirias* are, perhaps, the commonest Grasses of the high veldt. Bermuda Grass (*Cyniopsis dactylon*) is frequent beside roads, in lawns, and cattle kraals, and seems to be introduced by cattle, which are fond of it. The Reed (*Phragmites vulgaris*) is common along streams. A rainless winter of four to five months (May to September) and a fair rainfall (25 to 30 inches) the rest of the year has developed the habit of producing bulbs, tubers, and corn. Many of the plants flower without rain having fallen for months, but the heavy dews may help to start the growth. To some extent, also, the new Grass comes without rain.

*Galtonia (Hyacinthus) candicans.* (Nat. size.)

### Planting Stocks.

I have seen lately several bush or dwarf Rose plants of long and strong growth blown over by the wind, and in some cases nearly, if not quite, blown down. The cause of this is plainly a deficiency of fairly horizontal roots on the side from which the wind came.

But we must not necessarily conclude that there has been bad planting of the Rose as received, for I regret to say that my experience is that a large proportion of dwarf Rose plants sent out from the nurseries are wanting in all-round roots, and that not a few have unbendable roots on one side only, sometimes all in a bunch.

This is plainly owing to haste and want of care in planting out the rooted cuttings for budding. If they are just dobed in, in rows, as one would plant out Cabbages, with the roots all in a bunch in one hand, it saves, no doubt, a great deal of time and labour in the planting, and also in getting up the maiden plants for sale, for the spade may be put quite close to the plants on one side, as there are no roots there; but none of these can ever be perfect first-class maiden Rose plants.

Having seen lately the roots of some dwarf plants sent out by first-class firms, and having to-day had occasion to move a few of my own maidens and run-out stocks, it was impossible to avoid being struck by the difference of the spread of the roots. Amateurs in general no doubt are careful to spread out the roots horizontally in every direction when planting stocks; but will not our friends in the trade spend, if possible, a little more time and labour in doing the same, for we are, most of us, willing to pay accordingly for the best rooted and most perfect plants procurable?—W. R. RAILLEM.

### Book Notices.

#### The Horticultural Directory and Year Book, 1904.

The present is the forty-fifth issue of this publication, and as an up-to-date directory it has become nigh indispensable to nurserymen, seedsmen, florists, and gardeners. The editor of the Horticultural Directory has each year the assistance of many nurserymen and secretaries of horticultural societies throughout the United Kingdom, who send him batches of envelopes which they (the nurserymen especially) have had returned, and the editor immediately causes inquiry postcards to be sent to ascertain who is gardener, or what alterations have been made. We believe some thousands of postcards are yearly sent out for this purpose, besides which, the notifications of appointments that appear in the gardening Press are duly recorded. It should be distinctly understood that only gardens where two or more assistants are kept are here included.

Sometimes it appears that even reputable places are unrecorded. Wherever such an omission occurs the compiler would be pleased to have intimation of the fact. He, on his part, has solicited the kindly help of the entire gardening Press, so that as wide a circle of contributors as possible was appraised, and what could he do more?

It is hardly necessary to describe the arrangement of the Directory. Each county in the British Isles is recorded alphabetically, and the names of gardens, gardeners, proprietors, and the nearest postal address are tabulated in four parallel rows. The whole arrangement of names is alphabetical throughout. Foreign and colonial nurserymen and seedsmen, curators of botanical gardens at home and abroad, secretaries of societies, and superintendents of parks are here listed, so that the representation is very wide. This year the names of the Victoria Medallists of Honour in horticulture are furnished, together with the names and addresses of horticultural instructors in England, Scotland, Wales, and Ireland.

Mistakes appear in places. That is, perhaps, excusable where 13,000 addresses are dealt with, but we would ask purchasers to note that the secretary's address of the Royal Gardeners' Orphan Fund is now 30, Wellington Street, Strand, London, W.C., and not the one given in the Directory. The price is 1s., or 1s. 3d. post free, from the offices of this journal.

#### Publications Received.

"The Amateur Gardeners' Diary and Dictionary," price 1s. This is published by "Garden Life," Hatton House, Great Queen Street, London. It contains cultural notes on the back of each leaf, the opposite side being blank for notes. \* \* "Journal of the Kew Guild," 1903. Vol. II., No. XI., contains many interesting letters from

Old Kewites in all parts of the world. There are also portraits and memoirs of A. Godefroy Lebeuf, Robert Mackellar, and G. S. Jenman, each deceased, and of Mr. W. Lathom, who recently retired from Edgbaston Botanic Garden. \* \* University College, Reading. "Scholarships for Young Gardeners."

"The American Florist." \* \* "Le Jardin." \* \* "Garten Flora." \* \* "The Journal of the Department of Agriculture of Victoria," November, 1903, part IV. Contents: The Need for Soil Investigations, How to Foretell Frosts, Spraying for Black Spot in Apples, Ringing the Currant Vine in Greece, Rainfall in Victoria, Fruit Pulp, Flax Cultivation in Europe, Kerosene Emulsion as an Insecticide, &c. \* \* "Report on Experiments on the Manuring of Turnips in 1901," by R. Patrick Wright, F.R.S.E., Professor of Agriculture, West of Scotland Agricultural College, Glasgow. \* \* "Report on the Relative Effects of Superphosphate and Basic Slag upon the Feeding Quality of Swedes," by John W. Paterson, B.Sc., Ph.D., Prof. of Chemistry, West of Scotland Agricultural College. \* \* "Agricultural Returns of Great Britain, 1903" (Produce of Crops) Board of Agriculture and Fisheries, 3, St. James's Square, S.W. \* \* "Le Mois Scientifique." \* \* "Annual Report of the Smithsonian Institute, Washington, 1901 and 1902." These are two stout, cloth bound volumes numbering over 450 pages each, and 9in by 6in.

### Certificated Plants.

(Continued from page 559, vol. 46.)

THE POTENTILLA, now a much less popular plant than it was formerly, is, after all, not quite neglected, as sometimes a variety or two put in appearance in a collection of cut hardy flowers. No novelty in Potentillas of a striking character has come before the Floral Committee since 1895, when Mr. Maurice Prichard obtained an award of merit for the double yellow *P. californica*, a valuable variety which does not appear to have found its way into general cultivation. Of the most popular of the double varieties, and those which are most largely grown, are Louis Van Houtte, dark crimson, and the glowing orange-vermilion, William Rollison.

Strange to state, no award was made until 1878, when Prince Arthur obtained a certificate of merit; but it is not to be met with in any present-day list of hardy plants I have been able to consult. Some of the species or sub-species, of which there are a very large number, such as *P. atro-sanguinea*, *P. Hopwoodiana* (white shaded with rose), *P. nepalensis* (formosa), and a few others can be met with in old gardens, and when well grown they add greatly to the gaiety of the garden on account of their floriferousness; but many of the more modern varieties are of somewhat loose growth, and need to be tied to stakes in order to display their charms to the best advantage.

#### The Genus Primula.

The genus *Primula* looms largely in the lists of certificated plants. I have already dealt with *P. Auricula* under that heading. I can claim the honour of having obtained the first award made to a single Primrose, when I gained a certificate of merit for the rich maroon-crimson, *auriculæflora* in 1873. I had previously exhibited this on several occasions, only to find it passed over; but a little importunity goes a long way, and at last the certificate was gained.

It was by crossing this on to *P. altaica*, a single deep lilac Primrose which was distributed by the late Mr. Charles Turner some twenty years previously, that there was gained that break in the single Primrose which originated the fine coloured varieties so plentiful in the present day. There was some difficulty in convincing the committee that the Primrose was worthy its consideration, but, when accomplished, my Violet Gem obtained an award in 1873, followed by Splendour and Violacea in 1874, and later by Brilliant, Amaranth, Ealing Crimson, Octoroon, &c. A little later came the late Mr. G. F. Wilson, with his blue varieties, Scott Wilson, G. F. Wilson, Oakwood Blue, James Nimmo, Hermann Wilson, and others; and yet, a little later, Mr. J. H. Arkwright obtained an award of merit in 1898 for his large yellow Evelyn Arkwright. *P. Elatior*, the Polyanthus, also underwent great improvement, and in course of time several varieties of my own and others' raising were recognised by awards.

The Giant or Fancy Polyanthus has come to be regarded as one of the most popular of spring bedding plants, and fine strains are now quite common. *P. sinensis* has been largely recognised by the Floral Committee. In 1860 the late Mr. C. Turner obtained a certificate for *sinensis atro-rosea plena*, while Mr. W. Bull had commendations in 1861 for *nivea plena* and *rosea plena*. In 1865 Messrs. Windebank and Kingsbury, of Southampton, who did so much for *P. sinensis* in the early days of its improvement, had a certificate for *Kermesina splendens plena*; Mr. R. Parker, one for a double white in 1868; and a little later Mr. C. Turner had an award for a semi-double striped variety. It is curious to notice that as soon as attempts were made to cross-fertilise the best of the single varieties, semi-double forms at once put in appearance, and they were not the

products of the old Double White and the Double Red, as is sometimes supposed, as neither of them produces seed.

In the early seventies, certificates of merit were awarded to three forms exhibited by Messrs. E. G. Henderson and Son, viz., Emperor, Exquisite, and Magenta King; and subsequently Gilbert of Burghley Park, Hillier of Winchester, and Tomkins of Birmingham, produced double varieties, which are still occasionally to be met with. Later still, Messrs. Sutton and Sons, of Reading, obtained some double varieties, the most important being the blue colour on Fern-leaved foliage.

I believe I am correct in stating that Messrs. E. G. Henderson and Son were the first to introduce the Fern-leaved type, but with whom it originated I cannot say; they obtained a commendation for Filicifolia in 1861, and subsequently for a white and a red form; later in time a very fine double red with a Fern-leaved foliage was obtained by Messrs. Windebank and Kingsbury about 1866.

The first of the single varieties of *P. sinensis* to obtain an award was Delicata, from Messrs. F. and A. Smith, of Dulwich, in 1862; and also, in the same year, one for The Fairy. Then Messrs. Windebank and Kingsbury produced and obtained certificates of merit for some seven varieties between 1865 and 1869.

A few weeks afterwards Mr. William Paul received a certificate for a single variety named Waltham White, a large white flower having dark flower-stems and leafstalks. Other varieties certificated in the seventies were Finbriata cœrulea, Coccinea, Chiswick Red, Rubro-violacea, and several other double forms. In the early eighties Mr. Henry Cannell came to the fore with Delicata, Dr. Denny, Emperor, Swanley Purple, Swanley Red, &c. In 1882 Messrs. Carter and Co. gained a certificate of merit for Holborn Blue, the first of the improved grey-blue varieties, the type having come from Germany.

Subsequent improvements which obtained awards came from Messrs. H. Cannell and Sons, who produced such fine varieties as Bridesmaid, Eynsford Pink, Eynsford Red, Her Majesty, Kentish Fire, Peach Blossom, Pink Queen, Princess, &c.; and by Messrs. Sutton and Sons, whose Giant Rosy Queen, Gipsy Queen, Rosy Queen and others marked a distinct advance, and especially some varieties they have produced since the publication of the list of certificated plants.—R. DEAN, V.M.H.

## The Liliaceæ.\*

(Concluded from page 553.)

### ARCHELIRION.

*L. auratum*, "the Golden-rayed Lily of Japan," is the queen of this section, and also of all the other sub-genera. It has been suggested that this species is a hybrid because its introduction was at a comparative recent date compared with some other Japanese species. Why it was not collected over 100 years ago is probably because, as a wild plant, it is found all over Nippon (one of the largest islands of the Japanese Empire), where, until 1859, foreigners were not allowed to travel. Of its varieties, "macranthum" and "Wittei" are the best of the light-coloured kinds, whilst the red-banded, rubro-vittatum and "Crimson Queen" are by some regarded as hybrids of *auratum* x *speciosum*. Regarding the nomenclature of the white varieties of *speciosum*, there has lately been an amount of controversy (or advertisement?) in the gardening Press.

From observation of the plants that have come under my notice, I would venture to offer the following as correct:—*Kraterzi*, the "Japanese album," is a pure white distinct form, with very reflexed flowers, the petals of which are markedly finbriated on the margins; pollen, yellow or dark; stigma dark; midribs and stems green. The "Dutch album" is a rubrum in every detail except colour. Flower with flatter, less reflexed petals; pollen and stigma dark; exterior of petals (markedly in the bud state) suffused with a dark tint, also back of midribs and stems distinctly dark. *Album novum*, the best of the whites, has, combined with a more robust habit, a larger and more symmetrical flower, with yellow anthers, green midribs and stigma. It is interesting to note that this variety (described as new) is identical with the *albiflorum* described in Curtis's "Botanical Magazine" many years ago. Amongst these varieties I cannot find any to agree with *roseum*, which, in the true form, has always a green stigma and midribs.

Allied to *L. speciosum* by its leaves and to *L. tigrinum* by its flowers, is *L. Henryi*, a very handsome yellowish-flowered species. This is a form which has vastly improved when compared with the wild plants found by Dr. Henry. It is perfectly hardy, and frequently attains a height of 7ft to 8ft, producing from twenty to thirty flowers.

### ISILIRION.

Of the erect flowering species, which are the *Liliums* most frequently planted in borders, and of which we have numerous garden varieties, mention may be made of *L. elegans*, var. *Alice Wilson*, which is one of the best early-flowering varieties; and

*L.-c.* var. *Batemani*, decidedly the best late flowering one. *L. croceum*, the "yellow Lily" of the cottagers' gardens; *L. dauricum umbellatum*, and *bulbiferum* are equally worthy of a place.

### MARTAGONS.

The American species are essentially peat-loving subjects of easy cultivation and unique beauty. The freest grower is *L. pardalinum*, which in California is almost a weed, it increases so rapidly. It attains a height of from 6ft to 7ft, and produces its leaves in single whorls, whilst those of *L. Humboldtii*, a nearly allied species, are produced in biserrate whorls. All to this *L. superbum*, which has bright orange crimson, heavily spotted flowers, and we form a striking trio. Burbank's hybrid *pardalinums* are deserving of extended cultivation. Many of them have this summer produced over thirty flowers on a raceme. *L. Grayi*, ruby-red, spotted with claret, and *L. canadense*, with its varieties, are slender growing forms with annual bulbs, also from America.

The two best scarlet flowered species belonging to the Old World are *L. chalcedonicum* and *L. pomponium*, and it appears superfluous to say that *L. candidum* is the finest white. *L. monadelphum* (golden yellow), with monadelphous stamens, and its variety *Szovitzianum*, rich citron spotted with black, and possessing free stamens, are the best of the early flowering yellows. The seedling bulbs of *L. monadelphum* are, according to one authority, said to increase in size below the soil without producing a green leaf, for two years.

Of hybrid forms, *L. x Kewense* is decidedly the best. This is a cross between *Henryi* and *Browni*, var. *choloraster*, which, in flower, habit, and bulb, closely resembles *L. auratum*. The cross was effected in July, 1897, and flowered July, 1900. *L. candidum* x *chalcedonicum* yielded the nankeen yellow form *L. x testaceum* (syn. *excelsum*). *L. Dalhansonii* is the result of a cross between *Martagon* var. *dalmaticum* and *Hansonii*; whilst Burbank's hybrids are of mixed parentage, including *pardalinum*, *Washingtonianum*, and *Parrvi*.

### Tulipa.

Since the days of the Tulipomania, when bulbs which sometimes had no existence, were sold from 2,500 to 4,600 florins, the "Sweet Tulips" have been intimately associated with "spring loves" and "budding poets." By reason of their varied hues, markings, and intensity of colour they stand pre-eminently in the front rank of spring-flowering plants. The genus comprises about fifty species, only seven or eight of which are cultivated. They are natives of North Africa, Europe, and Central Asia. The natural colours are yellow, scarlet, and violet of various hues, white being merely a decolouration. Those generally known are essentially florists' flowers, which are all derived from *Gesneriana*, which was introduced into Europe in 1556.

The florists' varieties are divided into four classes. Breeders, self-coloured forms, deriving their name from the fact that self-coloured flowers are always the first product of the seed. This character they may retain from three to twenty years, when the colour becomes "broken." They are then termed Rectified Tulips, being now divided into Bizarres, if the ground colour is yellow, and the markings range from brown, through scarlet to black. Byblémens are so named when the ground is white and the markings purple, lilac, or nearly black; and Roses, when the ground is white, the markings being rosy or shades of pink. When the markings are confined to the margins of the petals they are called "feathered," whilst a "flamed" flower is a feathered flower in which there is a beam of colour running up the centre of the segments from the base to the markings.

Darwins may be aptly described as true *Gesneriana* breeders, whilst the Rembrandts are feathered Darwins. In the scope of this paper it would be impossible to deal with varieties, and my remarks will therefore be confined to species and hybrids.

A. Segments uniform, acuminate: *T. acuminata*, *elegans retroflexa*. B. Segments not uniform: *T. Didieri*, *Billietiana*; C. Segments rounded at apex: *T. Gesneriana*, *macrosepala*. D. Segments acute: *Suaveolens*. E. Segments obtuse and peduncle pubescent: *T. Greigi*, *T. maculata pubescens*.

*T. suaveolens* yields our early Duc van Thol varieties. The Brides of Haarlem are derived from *pubescens*, which is itself a hybrid between *Gesneriana* and *suaveolens*. Whence we have the Parrots is still an open question. Some hold that they are descended from *Gesneriana* var. *Dracontia*, whilst it is also contended that they are derived from *platystigma*.

Of yellows, *retroflexa* is the best; two smaller species are *sylvestris* and *primulina*. *T. violacea* is a violet-coloured *sylvestris*, with which it agrees by its tuft of hairs at the base of the stamens. *T. Clusiana*, a delicate white, flushed red, and black basal blotch; and *T. Sprengeri*, dazzling vermilion, are two handsome very late forms, flowering in the beginning of July. *T. Kanffmanniana*, a mixture of red, yellow, and white, is the best early Tulip, flowering about March 20. In conclusion, I may be excused for quoting a higher authority when I say, "Consider the Lilies, how they grow."

\* A paper read before the Kew Gardeners' Guild by Donald MacGregor. The sequence is based on Mr. J. G. Baker's classification.

### Strawberries in Pots.

When the crowns of the plants that were started at the beginning of December to afford ripe fruit at the close of February or early in March commence swelling, and the trusses appear, the temperature may be advanced a few degrees by day, but 50deg to 55deg is sufficiently high at night. Syringe the plants lightly in the early part of fine afternoons. Examine the plants daily, and supply water to all that require it. Keep a sharp look out for aphides; they cluster on the swelling crowns, and if any appear, vapourise with nicotine, or fumigate with tobacco paper on two or three consecutive evenings. It is very important that the plants be perfectly clean, and fumigation must not be practised when they are in flower.

Another batch of plants should be placed in a house from which frost is excluded, removing the decayed leaves, loosening the surface soil, and, after removing the loose material, supplying a top-dressing of rich compost with a little steamed bonemeal added to it. Attend to the drainage; if defective rectify it, and wash the pots. The plants must be introduced during the next three weeks to shelves in a Peach house started at the New Year, or within a Strawberry house. La Grosse Sucrée, Vicomtesse Hericart de Thury, and Royal Sovereign are suitable varieties; also Keen's Seedling, Sir Harry, and President, with Noble.

Plants for starting later will be quite safe in their quarters outdoors, plunged in ashes to the rims of the pots, and a light covering of dry fern or litter may be given in severe weather, allowing to remain until the plants are thawed after being hard frozen; otherwise remove and expose fully in mild weather. If the plants are placed in frames the lights should be drawn off in mild weather, but in this and wet tilt the lights at the back of the frames, so as to throw off the rains yet let the plants have plenty of air. They cannot be kept too cool, and none should be allowed to suffer through want of water.—A.

### Late Melons.

The dearth of hardy fruits for the winter stimulated an effort to continue those of summer into as late a period of the autumn as circumstances permitted. The season so bereft of its customary solar warmth, and with a contrary excess of rain, greatly hindered such a commendable object, not only in the actual growth of the plants, but their maturity of fruits and in flavour. Without the latter attribute Melons do not call for much favourable comment, though even when this is absent to an appreciable degree they still pass the daily courses of the dining room. While some kinds are good for late use and growth, others are comparatively valueless. It does not matter much what the colour of the flesh may be, there must be constitution, and a firmness of flesh and skin that will endure a slow progress, and the fruit remain sound for some days after being cut from the plant. This is rendered necessary, inasmuch as the gardener, anxious to place such crops to the best advantage, must needs keep them, as far as conditions allow, for special occasions. Shooting parties are, by common consent, frequent and perhaps necessary in November—some early, others late in the month; and as such events are not always made known to the gardener months prior to their date, provision can only be estimated in a sort of general way. I have frequently found that after Melons have been carefully stored, awaiting the eventful days, they collapse almost within a few hours of the time, and for this reason the growth of Melons becomes a matter of uncertainty in use or purpose.

In summer time, given normal weather, one may more easily calculate for special dates in the maturity of the fruits, but the case is different when one undertakes to provide such fruits for November. We have found British Queen, Duke of York, and Western Hero very good sorts for late use, but even these are eclipsed by the newer Late Perfection sent out by Messrs. Veitch. At Longleat, Mr. Gandy, Lord Bath's able gardener, has been most successful in providing November Melons, not only of large size—from 3lb to 6lb each—and in goodly numbers, but the flavour of the fruits has won considerable praise from host and guests alike. Gunton Scarlet is a favourite for the summer with Mr. Gandy, but it cannot compare with Late Perfection for November. In such a season Melons are usually judged from an ornamental rather than an economic aspect at party times; but in 1903, when Apples, Plums, Medlars, and Pears are so scarce, their appearance and value become considerably enhanced. A common trait with late Melons is for

the plant to collapse before the fruit has properly ripened, demanding an interval of time more or less prolonged on a shelf in a warm structure, so as to aid this chequered progress of ripeness. For this reason, probably, more than any other, the character of late Melons stands low; they fill a place usefully as an ornament, when there is an ample supply of other fruits more tempting in their quality for actual dessert use. At Longleat the houses are light, well heated, and roomy, and soil so well furnished for Melon requirements that, I am told, nothing need be added to improve it; but even given all these good accessories, fine Melons in November are rendered none the less praiseworthy from a grower's or consumer's point of view.—W. S.

### Forced Pot Vines.

When the buds break, the temperature will need to be increased by 60deg at night in mild weather, and 55deg when severe, gradually increasing it so as to have it 60deg at night when the Vines are in leaf, and from 65deg to 75deg by day, with moderate ventilation. Sprinkle the floors and surfaces of borders or beds twice or thrice a day in clear weather, avoiding too close and damp, or too damp or too dry an atmosphere. Afford liquid manure whenever moisture is required at the roots, always supplying it at the mean temperature of the house, or that of fermenting material, about the pots, being careful not to make the soil sodden and sour by needless supplies. Disbudding must not be practised until the bunches show in the points of the shoots, as any extra growth goes towards increasing the activity at the roots.—VITIS.

### Cherry House.

The house containing trees for supplying ripe Cherries from the middle of April onwards must now be closed. Be sparing of fire heat at the commencement, not applying it unless absolutely necessary to maintain the temperature at from 35deg to 40deg at night, and 40deg to 45deg by day, ventilating when the temperature is about 50deg to 55deg. Close the house at 50deg. Syringe the trees early on fine afternoons, so as to admit of the buds becoming fairly dry before dark. The house will also need damping in the morning and afternoon of fine days, occasionally only in dull weather. The border will be sufficiently moist for some time, through the removal of the roof lights; if not, it must have water to bring it into a thoroughly moist state. Trees in pots, if at all dry, will require repeated supplies of water to secure the thorough moistening of the soil down to the base of the pots.—G. A.

### Fruit Growing in Queensland.

The Minister for Agriculture in Queensland, desirous of assisting fruit growers in his State by establishing new markets, has bought up the whole of the season's crop of "Cape Gooseberries," a fruit which makes a delicious preserve, for pulping; and inquiries are being made in Great Britain as to the feasibility of establishing an export trade in this article on payable terms. Cape Gooseberry jam can be purchased in London, and as a table delicacy it would, were it generally known, be greatly appreciated. The Queensland Agricultural Department is also thinking of trying an experimental shipment of Pineapples to London, in order to test the transit question thoroughly. Pineapples are produced in Queensland as freely as Apples are here. In the Brisbane district alone close on 200,000 dozen are grown yearly, and all over the State these delicious fruits are cultivated, and are an ordinary item of dietary. If shipped to this country, it would be on a commercial basis, and the fruit would be sold cheaply.

Bananas are produced in Queensland in enormous numbers; the average annual crop may be put at about 2,000,000 bunches; and taking, say, 120 "fingers" to a bunch, we get the estimated yield of single Bananas in Queensland for a year as 240,000,000! Bananas flourish everywhere on the coast lands, and many small settlers make a decent living by taking up virgin scrub at £1 an acre and growing Bananas thereon after clearing. The Banana has the virtue of bearing all the year round, in congenial conditions.

Mangoes are grown in Queensland with such ease that, in good seasons, the local demand is unable to deal with the output: 1902 was a bad year for Mangoes, but in 1901 some 350,000 dozen Mangoes were grown in the State. After some hesitation in taking to this fine fruit when it was introduced, about twenty years ago, Queenslanders now regard it as a commonplace, and, raw and preserved, it is eaten all over the State. Oranges suffered from last year's drought, but their cultivation in normal seasons is an important section of the fruit department; about 20,000,000 Oranges were grown in 1901. There is a large export trade in all these fruits mentioned to the Southern States of Australia, Queensland being the supplier of all the tropical and sub-tropical fruits to Australasia. The area of Queensland is so extensive (669,000 square miles), and the climate so varied, that in one part or another every known fruit flourishes. Cocoa-nuts are grown on the islands which fringe the northern coasts in great numbers.—N. Q. H.

### Pear, Bergamotte Esperen.

After the voluminous correspondence in our columns during April and May, 1901, on the merits of this Pear consequent upon the Council of the Royal Horticultural Society refusing to uphold the award of merit recommended by the Fruit Committee about that period, it will be unnecessary to say much of this variety now. Bergamotte Esperen is an excellent Pear where it succeeds, but some growers, i.e., those on cold soils, do not find it ripen well, or to produce good eating fruit. As a wall-cordon in warm soils it, however, produces fine-grained, melting sugar fruits, and bears very freely. Our illustration shows its character in this respect, and the fruits are each of a roundish form, 3ins broad and as deep. It comes in after Winter Nelis, lasting in use for dessert from February till April. "As it bears in clusters, the fruits should be carefully thinned."

### Packing for Export.

The barrel most commonly used in Nova Scotia is made of Fir staves and Birch hoops, holding about 140lb of fruit, and costing 10d. Barrels with staves of Maple or Elm with Elm hoops are used to a lesser extent, but are commonly used in Ontario, Upper Canada, and the United States. These hold about 150lb of Apples and cost 1s.

In packing, the bottom and bilge hoops are first nailed, then a thin layer of wood wool called "Excelsior," is placed at the bottom, next a sheet of white paper the same size as the end of the barrel. A layer of "headers" is then laid; these are Apples of average size, those best coloured being chosen. These are placed stem downwards. The barrel is then filled by carefully emptying in the fruit, using hinge-handled baskets. The barrel is gently shaken each time fruit is added, so as to pack the fruit closely. It is filled 1in to 2in above the rim. In order to get the Apples tightly packed so that they do not move after packing and become "slack" in travelling, a round board lined with sack-ing or saddler's felt is placed, padded side downwards, on the top of the Apples; the barrel is rooked on the floor if of cement, or if not, on a heavy plank. The Apples thus shaken and pressed sink to about the level of the rim; any spaces are filled with small Apples, then another piece of white paper is placed on the Apples; then the lid is laid on, and the screw or lever press is applied to the barrel to press the lid into position; followed by the tightening of the chime hoops and nailing of the heads and hoops together with the owner's name and address, are stencilled on the top of the barrel; the name of the salesman on the bottom.

### R.H.S., Scientific Committee (Sept. 15.)

*Violets diseased.*—Mr. Worsley showed specimens which Dr. Cooke pronounced to be attacked by *Urocystis violæ*, recently figured in Journal R.H.S., "Pests of the Flower Garden," plate I, fig. 19.

*Longevity of Fern spores.*—A communication was received from Mr. H. Coleby, Wargrave, describing an instance of a piece of a stem of a *Dicksonia*, possibly twenty years old, on which, when broken off and kept moist, seedlings of *Gymnogramma aurea* began to appear. It was suggested that the spores of the latter had lain dormant for that length of time. Mr. Druery contributed the following note: "I have raised Ferns from spores seven to eight years old. The conditions mentioned by Mr. Coleby strike me as being exactly such as to maintain the power of germination for a very long time—i.e., absence of stimulating moisture or warmth. I have no doubt that the Fern arose from dormant spores. It is remarkable that only one kind of Fern germinated, though we must assume that other Fern spores were present in the old *Dicksonia* stem." It was suggested, however, that the *Dicksonia* stem might have been previously utilised for growing only the *Gymnogramma*.

*Ash-wood with grubs.*—Specimens were received from Mr. J. Gregory, Croydon, with live grubs two years after the tree had been cut down. The wood outwardly showed no signs, but on being sawn asunder both dead and living grubs were frequently found. Mr. Saunders contributed the following observations: "The insects found in the Ash timber are beetles belonging to the family of Longicorns, and to the genus *Clytus*; but not being an English species, and

Pear, Bergamotte Esperen.

probably American. I have not yet been able to obtain the specific name. The grubs of these beetles are sometimes very long-lived, and they remain for years in wood where their presence is quite unsuspected. A specimen of Longicorn beetle has been known to emerge from furniture, the wood of which was felled twenty-eight years previously. It is now supposed that the grubs which take such a long time in undergoing their metamorphoses have been hatched from eggs which were laid in a tree which had just been felled, or was cut down shortly afterwards, so that the grub was soon obliged to feed on very dry wood from which it obtained but little nourishment."

*Albinism in Shirley Poppies.*—A communication was received from Mr. J. Bidgood, of which the following is a brief abstract. It will appear in full in the Journal of the R.H.S. He would recognise four forms of albinism in flowers—viz., incomplete, complete, partial, and local. After giving illustrations of the first three from Orchids, the last applies to Poppies. The original plant of the Shirleys had a white edging to the petals. It was evident, therefore, that this plant had a tendency towards albinism. The black blotch has disappeared from all Mr. Wilks' stock, being replaced by white. Other growers have experienced reversion to the black blotch. This is caused by a very strong solution of a dark red pigment contained in the epidermal cells on each surface of the petal; the usual cause of blacks being dark red overlying green, as on the leaves of *Arum maculatum*. The colour in the outer portion of the petals was also in the epidermal cells. On applying micro-chemical tests the behaviour of the colours of the two regions in question was very different. Strong sulphuric acid changed the black blotch to pink, brick-red, orange, the outer part the same, but passed on to yellow, finally disappearing. Iodine in potassium iodide changed the blotch to port wine colour; the outer part slowly faded. Solution of caustic potash changed the blotch to a deep blue, then faded out; the outer part to greenish-yellow, then faded out. Neither of the pigments shows the typical reactions of the cyanine series, and still less of the xanthic.

*Supertuberation in Potatoes.*—The following communication was received from Mr. F. C. Davidson, Wickham Bishops, Essex:—"M. N. Bernard propounded the theory, in 'Rev. Gen. de Bot.' that tuberisation was due to a fungus; and had found it in the Potato; by experiments there was a relation between the date of infection of the soil and the date of tuberisation. I would suggest a practical application of this theory." Referring to Dr. B. Dyer and Mr. Shrivell's paper on "Manuring Market Garden Crops" (Journal R.H.S., xxvii., p. 995) he observes—"That whereas such crops as Cabbages may be grown as well with artificial manure as with dung, indeed, it would seem better and far more economically; yet, this does not hold true of root crops, especially of Potatoes. For instance, in the early varieties the average crop for some years was—from 50 loads of dung, 7 tons 7 cwt.; from 25 loads, 5 tons 14 cwt.; from (no dung) phosphates and 4 cwt. of nitrate of soda, 3 tons 6 cwt.; and from the same, with potash, 4 tons 10 cwt. The gap here, though potash fills it up a little, is most striking. If dung be favourable to bacteria they may infest the soil and promote tuberisation. If this conjecture prove to be a fact, it might have a very great influence on the cultivation root crops."

## Trees and Shrubs.

### The Black Poplar and the Aspen.

These are quick-growing trees, with light-coloured foliage, and they are effective with a background of dark-leaved Conifers. They are, therefore, well worth consideration at this season. It is quite true that these two Poplars usually grow largest in moist soils, but they are cosmopolitan; they will thrive in almost any climate and any soil. We have seen both of them growing as large and as handsomely formed on a dry calcareous soil as the Black Poplar represented in the accompanying engraving. One may easily discern without any danger of being deceived which is an Aspen, not only by its leaves, but more certainly still by its inflorescence. The leaves of the Aspen are roundish ovate, the edge slightly wavy and toothed, downy when young, but quite smooth when full grown. The leaves of the Black Poplar are deltoid-pointed, toothed, with glands at the base of the teeth, and always smooth on both surfaces. We add a few notes relative to each species.

*Populus tremula*, the Trembling-leaved Poplar or Aspen, is a native of most parts of the British Islands, and is described by all our earliest herbalists, but by none in such scandalous terms as by old Gerard, all of whose female relatives must have been scolds. He says it "may be called Tremble, considering it is the matter whereof women's tongues were made, which seldom cease wagging." The continuous tremulous motion of the leaves arises from the even balancing of their discs, and the length and slenderness of their footstalks. Its popular name is derived from the Anglo-Saxon, and refers to that motion. *Epece* was its Anglo-Saxon name, and the same word is in that language synonymous with our "tremulous." Superstition has given birth to a legend, at one time prevalent in the Highlands of Scotland, and thus told by Mrs. Hemans. The Cross—

Was form'd of aspen wood; and since that hour  
Through all its race the pale tree hath sent down  
A thrilling consciousness, a secret awe,  
Making them tremulous, when not a breeze  
Disturbs the airy thistle-down or shakes  
The light lines of the shining gossamer.

In dry soils it does not attain a greater height than 50ft, but in moist situations it is often full 80ft high. It is not a long-lived tree, usually beginning to decay when seventy years old, and this, with its tendency to produce numerous suckers, renders it not desirable for ornamental planting near a lawn or flower borders. The wood is white, soft, and light, and is used by the turner for forming bowls, trays, and other utensils. It was so valued for making arrows that in the reign of Edward IV., 1464, a statute was enacted from which the following is extracted:

"Patten makers may make pattens of such Asp as is not fit for shafts.

"Asp timber is the best and lightest timber, thereof to make pattens and clogs, most easy for the wearing of all estates, gentiles, and other people, of any timber that groweth.

"Turners, carpenters, woodmongers, and cole-makers do occupy, expend, and waste yearly in their occupations a great quantity of all manner timber of Asp."

*Populus nigra*, the Black Poplar, probably so called because of its darker tints than those of the White Poplar. Its bark is browner, and the leaves have no white down on their under surface. It attains a height of 80ft, and its wood is one of the best for making turnery ware. It has been much used for flooring, and Mr. Young tells that it is so slow in taking fire that the flames were staved at that part of a building on fire constructed of this wood. It affords pasturage for bees, both by its catkins and the honeydew which is freely secreted on its leaves.

## Societies.

### Bristol: "Greenhouse Climbers."

The Bristol Gardeners' Society met at St. John's Rooms on Thursday evening last, and Mr. E. Poole, F.R.H.S., presided over a good attendance. The lecturer for the evening was Mr. Orchard, of Henbury, his subject being "Greenhouse Climbers." He named a selection of climbers suitable for the greenhouse, detailing the cultural directions for each in a masterly way. He emphasised the necessity for cleanliness, keeping down insect pests, which, if left, would cause a great amount of trouble. He advised gardeners to study their employers' tastes in the selection of greenhouse and other climbers. A good discussion followed, and he was unanimously accorded the best thanks of the Society. The prizes for the evening were for two bunches white Grapes, and were awarded to Mr. J. B. Brain (gr. Mr. Atwell) and Mr.

Howel Davis (gr. Mr. Curtis). Certificates of Merit went to Mr. W. E. George (gr. Mr. Scott) for 3 well-grown plants of *Begonia Gloire de Lorraine*, and to Mr. F. C. J. Fisher (gr. Mr. Shelton) also for a large plant of the same, and one to Lady Cave (gr. Mr. Poole) for a collection of cut foliage of greenhouse climbers. The Society's annual dinner takes place at St. Stephen's Restaurant to-night, November 17.

### Sheffield: "Plant Life in the Alps."

At the monthly general meeting of the Sheffield Chrysanthemum Society, Professor Denny gave an interesting lecture on "Plant Life in the Alps." After explaining and illustrating the laws and structure relating to the growth of plants living at or about the sea level, the lecturer drew some interesting comparisons of plant life in the Alps. From the base to the summit of Mont Blanc plant life altered in degree according to the change in climatic conditions. Illustrations were given, showing tall and symmetrical trees growing at the base of a mountain. On the top of a mountain plants were subjected to great heat from the sun during the day, and to intense cold at night. Plants on the sea level were not affected by such extreme climatic influences. As the cold was supreme longer than the heat, the portion of the plant above ground was reduced in proportion to the height, until the highest forms were mere dwarfs. Where there was perpetual snow, plants were scarce. The Alps proper were the middle regions where pasture land existed, at any rate during the summer months. Though leaf development was not apart from the growth of root, the altered climatic conditions caused a stunted growth above the surface, while the hidden part of the plant developed to what seemed undue proportions in the endeavour to find warmth.

Exposure to wind also hindered the growth of the plant above the surface. The leaf and flower, though not possessing long stalks, grew in thick clusters and wholly covered the surface of large areas. By this means warmth was retained in the soil and cold was kept out. Water was necessary, but, if the plants were not able to drink, they might as well be in a desert. Neither too little nor too much was congenial to the plant, and some Alpine plants had a covering of hair, which regulated the passage of water and the radiation of heat. Many interesting conditions suitable to the life of Alpine plants were explained by the lecturer. An important feature was the perpetuity of the Alpine flora which has the agency of insects for fertilisation only in a small degree. Perpetuity depended upon the seeds and the taking root of the leaves which clustered close to the surface. Falling leaves resting in crevices formed a large part of the perpetuity of the plant. Referring to the bright colours of the flowers that grow on the Alps, the lecturer remarked that practically the only insects flying to these heights were the bee and the butterfly, the latter being able to get much higher. It had been proved by naturalists that the favourite colour of the bee was blue, and the colours that attracted the butterfly purple, red, or pink. These preferences by Alpine fertilisers accounted for the almost exclusive colours of blue, purple, red, and pink, among flowers on the heights. Insects at a lower plane had preferences, as yellow for beetles, white for flies. The butterflies were, therefore, responsible for the preponderance of the gay colours of the higher Alps. Other interesting points, such as the penetration of snow and ice by the warmth generated in the growing flower, concluded a highly interesting lecture.

### Devon and Exeter: Stove Plants.

At the Exeter Guildhall on December 16 a good attendance of the members of the Devon and Exeter Gardeners' Association assembled to hear a paper on "Stove Plants," read by Mr. Curtis, of Bristol. The chair was occupied by Mr. J. Coutts, of Killerton Park, who, in introducing the lecturer, spoke of the excellent fraternal feeling which was engendered by the interchange of lecturers with the Bristol Gardeners' Society, as in the present instance. The lecturer said he was deeply interested in stove-reared plants, and confessed there was no other branch of gardening that claimed his attention more. The great secret in the successful culture is cleanliness. The flowers when expanded disliked syringing, and soon turned yellow when so treated, the buds dropping off. Foliage plants next claimed the lecturer's attention. The Croton, he thought, had most attraction for us, probably on account of its variety and deepness of colour. The essential in the cultivation of this novel plant was to get the leaves to curl in a perfect manner from axil to tip, at the same time having a well-coloured tone. Good drainage and fair amount of sunshine were the chief factors in gaining this. Crotons should not be excited at any period of their growth.

Voting for the best pot of *Cyclamen persicum* in blossom resulted in Mr. J. Rogers, of Marl House, winning with 87 points; Mr. G. Cole being 2nd, 57 points; Mr. Cork, 3rd, 41 points. Among the flowers exhibited were some remarkable spikes of *Calanthe Veitchii*, of a bright rosy pink, and with a great many flowers on the spike. A new Chrysanthemum from

Messrs. Veitch's nursery, said to be a sport from Madame R. Cadbury, was a very large, finely finished flower of a deep golden colour, the petals very broad and thick, thus partaking of the character of its parent. It has the further advantage of not damping off. The variety is not yet named. A beautiful white variegated Borecole named "The Albino" was also shown.

### Cardiff: Bees.

CARDIFF GARDENERS' ASSOCIATION.—At a meeting held at the Grand Hotel on Tuesday, December 15 (Mr. H. R. Farmer in the chair), Mr. W. Richards delivered a lecture entitled "Bees as Fertilisers, Florists, and Fruit Producers," illustrated by a series of slides. The lecture was thoroughly a botanical and educational one, for flowers and fruits were represented in their various stages before and after fertilisation, showing the result of the work of bees. The best thanks of the meeting were accorded Mr. Richards for his much appreciated lecture.—J. JULIAN.

### Dublin Seed and Nurserymen's Employés' Association.

On Saturday, December 12, at the Gresham Hotel, Dublin, the above newly-formed Association held an inaugural dinner. There was a large attendance, and the chair was occupied by Mr. A. J. Sinclair, who was supported by F. W. Burbidge, M.A., V.M.H., &c., on the right, and Mr. D. MacLeod, of Messrs. W. Drummond and Sons, Ltd., on the left. Mr. Burbidge proposed the toast of the Dublin Seed and Nursery Employés' Association. He was glad, he said, to see the junior members were so strongly in evidence, and thought the Association was bound to succeed. Mr. Hall, in response, said if there was anyone in Dublin who should recognise the value of that society it was the employers. In the seed trade they had much to learn, as nothing could be left to chance. He thanked them for responding so heartily to the toast.

Mr. Joseph Alexander Rochfort, in proposing the toast of "The Seed and Nursery Trades," said he was very sorry that they could not use the word profession instead of trades when referring to these businesses. He was of opinion, owing to its difficult and detailed nature and the amount of study one had to go through to be proficient, that it ought to rank as a profession (applause), or at least be brought up to a standard similar to the Pharmaceutical Society, which had an Act of Parliament to protect it. The seed and nursery trades were to his mind the closest allies the Department of Agriculture could have in working out their schemes for the improvement of agriculture in Ireland, to say nothing of reafforesting.

Mr. D. MacLeod, in reply, said he regretted the absence of their venerable president (Mr. David Drummond, J.P.), owing to the weight of years. Being on the verge of ninety, they could hardly expect him to be with them. He impressed on the young men the importance of fitting themselves for a higher sphere of labour, by doing more than the mere mechanical work at which they were employed. If they did this, they would qualify themselves for better and higher positions in the future. He hoped that before long that Association would have a domicile of its own, and in that domicile he hoped to see established as an aid to improvement, a library of books of reference on botany, and other kindred subjects that will qualify the young men to take a noble part in the useful sphere in which they are placed in this country, or in any country. He should also like to see there specimens of various plants, including weeds, so that those who studied would know where they grew, and all about them. As to the heads of the seed and nursery trade in Dublin aiding the Association, he was sure that he might safely say that they would not be backward in coming forward. The firm with which he had the honour to be intimately identified, would, he was sure, gladly give whatever support they could, and encourage the Association in

every possible way. Mr. J. W. Henderson proposed "Our Guests," to which Mr. Walter Keatinge, secretary of the Royal Horticultural Society of Ireland, replied. Other toasts followed, the proceedings concluding with the singing of "Auld Lang Syne." The hon. sec. of this Association is Mr. Jas. McDonough, of Sir Jas. Mackey's.

### Newport (Mon.): Six Good Vegetables.

NEWPORT (MON.) GARDENERS' ASSOCIATION.—The members of this association held their usual meeting on Wednesday, December 9, when Mr. J. Lee, member of the Bristol Gardeners' Association, read a very able paper on "Six Good Vegetables." Mr. Lee had been ordered by his association not to include in his paper such vegetables as Onions, Cauliflowers, Peas, Beans, Celery, &c., so the six he had selected were Potatoes, Cabbages, Vegetable Marrows, Turnips, out of doors Tomatoes, and Rhubarb. Early supplies of Potatoes are much appreciated, so Mr. Lee gave instructions how to grow these, more especially growing them in 10in pots on shelves in a greenhouse, also in pit sand frames on hotbeds. The variety he found to do best for this work was Sharpe's Victor.

Cabbages were next dealt with, and the sort he recommended for the earliest was Ellam's Early, being much appreciated in early spring. Directions were given for growing

The Black Poplar. (See page 588.)

Vegetable Marrows in pots for the earliest supplies, and out of doors for the later. Turnips taxed the skill of the gardener to have them in good condition all the year round, especially during the hot months. Tomatoes: Sow in March for outside work, grow them on to have them strong for planting out early in June. Rhubarb was much appreciated from Christmas until Gooseberries were fit for use, and Mr. Lee gave instructions for growing and forcing, so as to keep up a succession. A good discussion followed, in which Messrs. Harris, Basham, Jones, Powell, Woodward, and Daniels took part. A very hearty vote of thanks was accorded Mr. Lee for his very able and instructive paper. Mr. J. Duff presided over a good attendance.—J. PEGLER.

### Birmingham: Vine Culture.

BIRMINGHAM GARDENERS' ASSOCIATION.—An interesting and instructive lecture was afforded by Mr. Robert Cock, Horticultural Lecturer to the Staffordshire County Council, on the 14th inst., on "Vine Culture." Among a select list of the best varieties he particularly mentioned the Muscat Hamburg and Muscat of Alexandria as the best flavoured Grapes extant, the former not excelled by the latter kind. In the construction of Vine borders inside or outside, Mr. Cock strongly disapproves the adoption of brick walls and concrete floors, unless the natural surrounding soil should be of an unfavourable nature and the substrata excessively cold. Thoroughly consolidated borders (the surface especially) were advocated for inducing a freer root-action in the upper portion of the border. For interior borders, paving the surface with ordinary clay bricks, about 2in apart, with a view to conserve moisture and heat, thereby acting as a medium for attracting the roots towards the surface, was advised. In the formation of Vine borders, while advocating incorporation of old mortar rubble in the compost, Mr. Cock's experience led him to eschew that of old chimneys. He omitted however, to define the reason, excepting that he had known instances where the roots of newly planted Vines had absolutely refused to grow in such a medium, and that the whole of the border had to be replenished by a new one. It would be interesting to learn the experience of other cultivators regarding the matter in question, and whether the mortar rubble obtained from factory or dwelling-house chimneys alone possessed any distinctive chemical property inimical to Grape Vines or any other plant-root growth.

### Horticultural Club: Scented Flowers.

The monthly dinner of this club on the 15th inst. was followed by a most interesting joint paper by Mr. G. Bunyard and Mr. Jas. O'Brien on "Scented Inconspicuous Flowers." Mr. O'Brien naturally treated of the Orchid tribe, while Mr. Bunyard's remarks were of a more general character. With regard to the human faculty of appreciating odours, it was generally felt that man is little qualified to judge for the insect, or even the animal world, since, as Mr. Engleheart pointed out, it was impossible to form a scale of odours in the same way as we can of musical sounds or optical colours, and it is quite possible, and indeed more than probable, that while our eyes and ears are limited in their scope to certain ranges of audible vibrations, or a limited area of the spectrum, insect organs may be capable of appreciating, at any rate, sounds which are too subtle for our senses, and their olfactory nerves may also be so differently constituted as to be sensible of subtle scents beyond our ken. The case of rare moths in captivity attracting those of their kind for long distances was cited as an example by Mr. Druery, and while Mr. Charles Pearson considered that this attraction might be due to extremely high pitched sounds emitted by the captives, Mr. Engleheart quoted an instance in support of Mr. Druery's contention, which indicated the attraction of certain moths whose only habitat was seven miles distant.

Applying this to flowers, it is conceivable that inodorous ones to man, may nevertheless yet attract the needful insects by scent. The curious fact of certain recognised odours being common, not merely to flowers of quite different species, but even to animals and minerals, was brought forward, the pungent odour of the Onion being perceptible not only in other plants but also in the small snail, *Helix alliaria*, and in vaporised arsenic. Allusion may also be made to the singular cases of flowers with, to man, the most repulsive odours, attracting carrion flies in large numbers with the result that they laid their eggs in profusion upon such flowers, though these eggs were destined to perish since no real food, such as was suggested by the odour, existed for the future brood.

Some of the *Stapelias* possess this peculiarity, and Mr. Druery suggested the possibility of such plants being allied to carnivorous ones, the addled eggs acting as nutritives. The subtle nature of odours was also indicated, the musk glands of animals having the power for many years, not only of retaining their peculiar scent, but of imparting it perceptibly to the surrounding air and adjacent articles without any appreciable decrease in substance or weight.

Referring to the innumerable odours of the foliage apart from flowers, it was mentioned that such emanations had been

regarded as the throwing off of useless materials. This view, however, could hardly be justified, since there was undoubted evidence that in some cases these odours exercised a deterrent effect upon verminous foes. Both papers teemed with examples of curious relations between scent and inconspicuousness, while on the other hand it was pointed out that many very conspicuous ones had, as it were, two strings to their bow, being fully as odoriferous as their humbler relatives.

### Isle of Wight: Tomato Culture.

The monthly meeting of this horticultural association was held at the Warburton Hotel, Newport, on Saturday, December 5, Dr. J. Grove in the chair. Considering the inclemency of the weather there was a good attendance of members. The subject for the meeting was a paper read by Mr. E. C. Goble, of the Walcot Nurseries, Ryde, "On the Cultivation of Tomatoes." Mr. Goble is a large grower of Tomato, annually placing on the market tons of fruits, and has probably the largest glass structures in the island devoted exclusively to their culture. He said Ham Green and Chemin were good old varieties, while of newer introduction Up-to-Date was one of the best. Mr. Goble holds an opinion that the supply of these fruit somewhat exceeds the demand, so that it is sometimes difficult to dispose of produce at remunerative rates. The exhibit included a fine dish of tubers of the famed Northern Star Potato. From 6ozs of seed sets Mr. Bound, Freshwater, had secured 69lbs. Sutton's new Potato, Discovery, was also shown. Mr. Kime, Westhill, Yarmouth, showed a lovely Zonal Geranium, Mrs. Martin, of a lovely salmon pink shade. The annual meeting will be held on January 9.

### Ipswich: The Carnation.

IPSWICH MUTUAL IMPROVEMENT SOCIETY.—The year's work was brought to a successful conclusion on Thursday, the 17th inst., when Mr. R. Dean, V.M.H., gave a lecture on "The Carnation: its Types, Culture, and Uses." Happy recollections of a previous visit from Mr. Dean evidently conduced to the large attendance. By way of introduction the essayist first referred to the popularity of the flower, and then to its early history. The development of the old florists' Carnations and Picotees and their classification into various types was then treated at considerable length, and followed with evident interest by his audience. Mr. Dean then passed on to the consideration of the present day forms of border Carnations, likewise the Malmaison and Winter or Tree flowering varieties. Details of cultivation were given for all sections, as well as notes on the insect and fungoid pests to which the plants are subject. In the discussion which followed, Messrs. Messenger, Creek, Morgan, Bullard, and Finlay took a prominent part, the proceedings closing with a hearty vote of thanks to the essayist.—E. C.

The weather during the past week has been fair, but very dull and dark.

KENT FRUIT-GROWERS' ANXIETY.—Fruit-growers in Kent are anxious with regard to the prospect of next year's Black Currant crop owing to the continued ravages of the pest *Phytoptus ribis*, known to farmers as the bud mite. It attacks the wood as well as the buds of the plants, and acres of plantations have been affected. The pest has been spreading in the Hop country for the past seven years, and so far no cure has been found, although several methods of treatment check it to some extent.

## Young Gardeners' Domain.

The Editor welcomes short letters from under gardeners. Letters should be confined to 500 words in length, should be written only on one side of the paper, as clearly as possible, with one inch space at both top and bottom, as well as at the sides. The names and addresses of the writers must accompany all communications, not necessarily for publication, but as a guarantee of good faith. If these points are not respected, the letters cannot be considered.

### The Stephanotis in an Intermediate House.

The Stephanotis will thrive well in an intermediate house. I know of many that do, and even if a little later in their blooming, they are excellent in every respect. If grown in the latter temperature, they do not require too shady a place, and scarcely so much water. Mealy bug is the great enemy. This, with the many valuable fumigating compounds and insecticides, is easily exterminated in the early stages. Once let it get a firm hold, and a year's attention is soon gone—R. P.

### Greenhouse Lachenalias.

These free-flowering greenhouse bulbs give a grand display during the spring months, whether grown in pots, as an edging to the stages, or in wire baskets suspended from the roof, the latter method being very effective. Natives of South Africa, it is essential to their well doing that after the flowering period the bulbs receive a thorough ripening, placing them in as sunny a position as possible. About the middle of August shake out the bulbs from the old soil, and prepare a compost consisting of about two parts of loam and one of leaf soil, together with a liberal addition of coarse sand or lime rubble, and a sprinkling of finely-sifted dried cow or sheep manure, aiming to keep mixture as porous as possible.

If they are to be grown in pots, five-inch size will be found suitable, having them well crocked and clean, placing five or six bulbs in a pot, selecting the bulbs for each pot as evenly as possible. If, however, they are to be grown in baskets, have them well lined with fresh moss, in the bottom of which put a fine layer of soil, and place some of the bulbs upside down at a distance of about 3in apart, and gradually work up the sides, finishing on the surface, and just covering them with soil. Place them in a cool, shaded house, and syringe to keep them moist, but apply water carefully until growth becomes more advanced, when it can be more liberally given.

When the flower spikes begin to show, give some weak application of an approved fertiliser once or twice a week, but avoid pouring it into the axils of the leaves, or the spikes will probably decay. At this period a slightly warmer situation will help to bring up the flowers, but as long as the night temperature does not fall much below 40deg Fahr., they will take no harm. The two varieties most commonly met with are *L. tricolor* and *L. Nelsoni*, of which I prefer the latter.—JOURNEYMAN.

## The Bee-keeper.

Reply to "X. Y. Z."—The hornet is larger than the wasp, and may be distinguished from the British species of the latter by its reddish tint, and red spots on the sides of the abdomen. It generally builds its nest in trees. Queen wasps (the females proper) have stings. They are larger than the males, or workers, sometimes equal in weight to six of the workers, and produce both males and females. The smaller females lay only drone eggs. The queen bee also has a sting, which is used principally against rivals. It is similar in structure but curved and longer than that of the worker, with from three to five very small barbs. The poison sac contains only a milky substance entirely different to the venom of the worker.

## Trade Note.

Messrs. Cooper, Taber and Co., Limited, wholesale seedsmen, issue the following notice:—"In consequence of the exceptionally wet and sunless season, seeds generally have again been indifferently ripened and harvested, and many samples of Peas and Beans are somewhat stained. We therefore, beg our friends to unpack all goods immediately on arrival, and to recommend their customers to sow more thickly than usual."

### Trade Catalogues Received.

James Carter and Co., 237, High Holborn, London.—*Practical Gardener and Seeds for the Garden.*

## Hardy Fruit Garden.

**PRUNING BUSH FRUIT TREES.**—Large trained bush trees of Apples and Pears require but simple treatment in pruning, because as a rule the number and position of the branches are and have been fixed for some time. Trees long established, however, and sometimes when only recently formed and trained, may possess too many branches, or rather they are crowded, having in the first instance been originated too closely together. This has an important bearing on the continued fruitfulness of trees, and should as far as possible be rectified, so that each branch has a fair share of light and air. The best distance is from a foot to 15in, much depending on the size of the clumps of spurs. These must also be reduced in size and number if crowded, shortening those parts extending too far from the main branch. In shortening the current year's shoots leave as a rule two buds. The leading shoots must receive treatment in accordance with their development. If there is still further room for extension, shorten to one-third, otherwise the leading growths must be cut closely in. Weak growths and sappy growths cut out entirely, as well as any spray tending to choke the interior.

**OPEN BUSH TREES.**—Sometimes trees are grown in a less formal way, and are termed open bush trees. They have their branches disposed thinly, and the side shoots are more encouraged to form fruit buds than extend into growth. Those that do the latter must be shortened to form spurs. Shorten the unripe tips of leaders.

**PRUNING PYRAMID TREES.**—Pears are best adapted for this form of training, which entails the growths being restricted. The branches should be disposed at equal distances all round the tree, the lower, of course, being the longest. Shorten the side growths to two or three buds, and the leading growths of each branch must also be pruned closely back except where further extension is needed, when only shorten to ripe wood.

**PRUNING STANDARD TREES.**—Severe pruning of standard fruit trees is not desirable. If well cultivated from the first, and the branches originated in the best form, there should be little or no pruning, especially with Plums and Cherries. The lines, however, on which pruning should be done consist of thinning-out branches or shoots where crowded. Trees that have been neglected for some time will, of course, require most attention. The crowded interiors ought first to be dealt with, removing crossing and interlacing branches. Spray which starts from the old wood must also be cleared out. Avoid shortening back branches. Those which need removal must be cut out to the main. Leave no snags, and cut out dead wood.

**RASPBERRIES.**—The Raspberry quarters may be pruned and put into order. Many cultivators do not leave the pruning out of the old bearing canes until the winter season, but remove them immediately the fruit has been gathered. This is good practice, because it enables the current year's canes, which will be the future bearing canes, to become thoroughly well ripened, much more so than if they had been crowded among useless growth throughout the autumn. Even in these cases where the principal pruning has been done, there will still be weakly canes requiring removing. Leave the strongest and best ripened canes, limiting the number to five or six for each stool. The canes may be left their full length now, shortening them in spring to ripe wood, or to the tops of the stakes or trellis. New stock may be planted now in lines 5ft apart, or in clumps 3ft apart. Suitable plants for the purpose may be found among the clumps and between the rows, choosing those of comparatively slender rather than stout growth. The former will be found to have the best system of roots, these being of a fibrous character, hence more readily taking hold of the soil. The pruning of newly planted canes need not be attempted until spring, but when doing so cut down the canes close to the ground.

**LOGANBERRIES AND BLACKBERRIES.**—Well established plants will have produced long and strong growths. Select the ripest of them, and train to trellises, wires, or stakes. Remove the unripe ends. Cut out weakly growth and spray. In planting young stock place the suckers 5ft apart in deeply dug and well enriched ground. They may be cut closely down to the ground the first season, like Raspberries, so as to encourage the production of strong canes the following season, and which, becoming well ripened, will bear freely the suc-

ceeding summer. Established quarters will be greatly benefited by a liberal mulching of manure.

**JAPANESE WINEBERRIES.**—A plantation of this hardy fruit-bearing shrub may be treated in pruning similar to Black Currants, cutting out shoots that have borne fruit, and leaving the current year's growths. To increase the stock divide some of the old roots, and plant in good, rich soil in a sunny position in rows 3ft apart. Mulch with littery manure for the winter, and in summer afford a liberal dressing of rotten manure, and apply liquid manure freely when the fruit is swelling. —EAST KENT.

### Fruit Forcing.

**PEACHES AND NECTARINES: EARLIEST HOUSE.**—The trees must not be syringed after the blossoms show colour. Damp the borders in the morning and in the early part of the afternoon of fine days. Maintain the temperature at 50deg to 55deg by day, with an advance from sun heat to 60deg to 65deg, but not without ventilation at top and in front, 50deg being sufficiently high for the night. The house should be freely ventilated when the weather is favourable. Avoid cold draughts, however, but admit a little air by the top lights. Houses that have innumerable "chinks" of air may remain closed in stormy weather. The temperature must be raised early in the morning to 50deg, and then kept between that and 55deg through the day, but 55deg must not be exceeded by artificial means, nor an advance allowed above it without a free circulation of air, and it is not a good plan to close early in the afternoon at this stage. A close, moist atmosphere favours growth more than sturdy blossom, and is bad for the setting of the fruit. Under favourable conditions of the atmosphere the pollen is dispersed in a golden shower when the day is bright and ventilation has been attended to early; the setting of the fruit is then generally satisfactory, even without artificial fertilisation. The trees or trellises, however, may be shaken every day from the first pollen on a tree becoming ripe until the latest flowers thereon have cast their petals. A plume of Pampas Grass drawn over the blossoms lightly scatters the pollen, or a rabbit's tail mounted on a stick may be used similarly. A camel-hair brush passed over pollen-laden anthers and applied to the stigma of each flower is, however, the most certain method of artificial fertilisation, operating after the house has been ventilated some little time.

**SECOND EARLY HOUSE.**—This may be the first in some establishments, but in any case the trees, to afford ripe fruit in May or early in June, according to the variety, must be started without delay. Alexander, Duchess of Cornwall, and Early Rivers Peaches started from now to the new year will ripen the fruit in May. Hales' Early and Early Grosse Mignonne following closely; but Stirling Castle, Royal George, Noblesse, and Grosse Mignonne, started at the same time, will not ripen the fruit until June unless very hard forced, which is inadvisable. Fire heat should only be employed to keep out frost at night, and to insure 50deg by day, above which ventilate freely, and close the house at that temperature, except that a little air should be admitted constantly by the top ventilators in close-fitting houses. Bring the trees on slowly, not hurrying them in swelling the buds, and if these are abundant, rub off those on the under side or at the back of the growths. Sprinkle the trees in the morning and early afternoon of bright days only, damping the floor, sufficing when the weather is dull, and only then when dry. Apply water if necessary to bring the soil into a thoroughly moist state. Outside borders must be covered with about 3in thickness of leaves and litter to prevent the soil freezing, but avoid thick and rich coverings.

**SUCCESSION HOUSES.**—These cannot be kept too cool after the leaves are all down, and the trees have been pruned and dressed. If the roof lights are movable they should be removed whilst the trees are at rest. The frosts are never so severe as to injure the wood of trees in good health and profitable use, and the borders become thoroughly moistened by the winter rains and snow, so that they seldom require water until the fruit is taking the first swelling and entering on the stoning process. Trees under fixed roofs seldom have the soil thoroughly moistened, therefore the buds are imperfectly formed, and are cast when they should be developing into blossom. If the roof lights are fixed, the borders must be carefully examined, and water supplied to keep the soil thoroughly moist. Dryness at the roots during the rest period is a fertile source of the buds falling, and thorough watering will not do any harm provided the drainage is effective.

**UNHEATED HOUSES.**—When the roof lights are removed from these directly the leaves are all down, and they remain off until the beginning of March, the trees enjoy a complete season of rest as far as possible in our climate. Up to that time, or the swelling of the buds, they are simply frost-proof, for it is not these that suffer from severe frost, but the unripe wood, and that is worse than useless, as it falls a prey to disease. Danger to the buds begins when they commence swelling, and

having burst their scales, show the downy integuments that protect the blossoms. The pruning in such cases is usually deferred until the spring, which is a light affair when the trees are grown on the long-pruning system, and the useless parts cut out directly the fruit is gathered, so that the wounds heal at once, and the winter pruning is rendered almost nil. Where the roof lights are fixed, the house must be freely ventilated in mild weather, and even on frosty or fine days. Above all things see that there is no deficiency of moisture in the border, affording a thorough supply of water when necessary. —ST. ALBANS.

**\*\* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.**

**NATIONAL FRUIT GROWERS' FEDERATION.**—The secretary is Mr. H. T. Matthews, and his address 28, Eaton Rise, Ealing, W.

**DOZEN SELECT HOLLIES (F.I.).**—The common Holly (*Ilex Aquifolium*) is the most generally serviceable of all Hollies. The following green forms are good. Grecian Holly (*I. A. costata*), distinct and free-growing; Donnington's (*I. A. Donningtoniensis*), distinct, of free pyramidal habit; Henderson's (*I. A. Henderson*); Hodgins' (*I. A. Hodgins*), a handsome form; Noble (*I. A. nobilis*), a vigorous-growing form; Whittington's (*I. A. Whittingtoniensis*), an elegant and distinct form, variegated; silver-edged (*I. A. argentea marginata*); Handsworth's (*I. A. Handsworthiensis*), handsome free-growing; silver-striped (*I. A. argentea elegantissima*); Golden Queen (*I. A. aurea regina*); Hodgins's Golden (*I. A. Hodginsii aurea*); Waterer's Golden (*I. A. Wateriana*), a beautiful dense dwarf plant.

**FINDING CUBIC MEASUREMENTS (Working Gardener).**—For the lean-to multiply the length of the house by the width, the product by the height of the front of the house, and this will give the cubical contents of the lower part. Then take the height of the back of the house, deducting from it the front height and multiplying the length by the breadth, and this by the height, divide the product by two, and the remainder, added to the product of the lower part, is the contents of the whole. For a three-quarter span proceed in the same way for the lower part, and also for the upper part, but measuring from the level of the front to the ridge of the house. These matters are difficult to explain without diagrams, which we hope to give shortly, and as for piping required for bottom heat to a propagating house, that depends entirely on the width of the propagating bed, upon which point you give no particulars. Please do so, so that we may assist you.

**ROOTS FROM A BLACK HAMBURG VINE (Gardener).**—The roots are infested by the white root-rot fungus, *Rosellinia necatrix*, which, fortunately, is somewhat rare in Britain, although well known on the Continent, where it attacks vineyards and orchards in a wholesale manner. The fungus is naturally a saprophyte, but acquires parasitic proclivities under certain conditions. Preventive means and remedial measures are but little understood and of no use, and when the mycelium is established in the roots cure is out of the question. The root fungi, however, succumb to treating the soil with soluble creosote solution, such as the preparations known as Little's soluble phenyle and Jeyes' fluid—one fluid ounce to a gallon of water, and treatment with a solution of formaldehyde—1oz (fluid) to a gallon of water—certainly destroys all the mycelium reached, as well as any root mites and eelworms that are not unfrequently associated with the decaying roots. If taken in time, this procedure would probably be effective, the soil being thoroughly saturated with the solution. The only injury likely to result is that of the destruction of the young rootlets. The attack of the *Rosellinia* is probably induced by the border consisting of too rich and close materials, resulting in soddenness and decay of the roots, hence the fungus is encouraged as a saprophyte. We know of no better procedure than that you are pursuing, namely, lifting the Vines, removing all the old soil, cutting away all the decayed and affected parts of the roots, promptly burning them, and relaying the roots retained in sound material of a calcareous and ferruginous nature.

**ORCHIDS AT CHELTENHAM (A. H.).**—Thanks, and will use notes in next issue.

**CHRYSANTHEMUM BOOK (R. B.).**—The matter will be considered by us, and we will let you know shortly.

**CHRYSANTHEMUM ANALYSIS (Northerner).**—We hope the analysis will be published in next week's issue.

**ILLUSTRATION OF CACTI (W. G.).**—Unfortunately the photograph had been sent to the blockmaker ere your letter reached us.

**WEIGHT OF BANANA.**—Your friend's bunch weighing 45lb is hardly a record weight. Mr. Jordan, gardener at Impney Hall, Droitwich, in November, 1901, cut a bunch weighing 100lb. Some of the fruits weighed 7ozs each.

**DESTROYING MOSS AND OBNOXIOUS WEEDS ON LAWNS (Norhants).**—As you have tried some of the advertised lawn manures, and also wood ashes, with not very satisfactory results, we fear not any substance applied at this time of year other than a good dressing of compost, consisting of thoroughly decayed vegetable matter placed in a heap for some time, and incorporated with a sixth part of lime, applying about twenty cartloads per acre, spreading evenly and leaving for the winter. In spring the rough could be raked off, stones picked, and the ground well rolled. This we have found very effective. Lawn sand, the active principle of which is sulphate of ammonia, may be applied now for destroying such broad-leaved weeds as Daisies. The mixture of nitrate of soda and sulphate of ammonia, equal parts, is as good as anything you could use, 1lb of the mixture being applied per rod (5½ square yards), commencing the dressing in March and repeating several times during the summer.

**SIX OF THE BEST STREET AND TOWN TREES FOR GENERAL UTILITY (Citizen).**—1. The Oriental or Common London Plane (*Platanus orientalis acerifolia*) not only grows vigorously in towns, but is peculiarly well adapted for withstanding the smoke and other impurities of their atmosphere. 2. The Black Italian Poplar (*Populus monilifera*), next the London Plane, is the most valuable for planting in smoky towns, its broad leafage being very bold and effective. The Canadian Poplar in the variety *nova* (*Populus canadensis nova*), however, rivals the Black Italian Poplar in rapidity of growth, and is a very superior tree for street planting. 3. The Ailantus, or Tree of Heaven (*Ailantus glandulosa*) thrives well in towns, and is very handsome. 4. The False Acacia (*Robinia Pseud-acacia*) is beautiful alike from leafage and flower. 5. The Tulip Tree (*Liriodendron tulipifera*) possesses a garb of rich, bold greenery, and from its smoke-resisting properties stands high in the rank of town trees. Mention must also be made of the Black and White Mulberry trees (*Morus nigra* and *M. alba*), excellent town trees. 6. The Cucumber Tree (*Magnolia acuminata*), splendid in its bold foliage. Note must also be made of the Maidenhair Tree (*Ginkgo biloba*), as it succeeds well in the impure atmosphere of a town garden.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. F. S.).—*Tibouchina* (or *Lasiandra*) *macrantha*. (Leon).—1, *Cupressus Lawsoniana*; 2, *Pinus excelsa*; 3, *Daphne Laureola*. (F., Hants).—1, *Costus igneus*; 2, *Cattleya labiata*; 3, *Cypripedium x Leeanum* var.; 4, *Cattleya x Sallieri*; 5, *Cypripedium x Williamsianum*. (W. S., Sussex).—*Lælia anceps*.

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (P.).—1, Byford Wonder; 2, Fallawater; 3, Winter Peach; 4, Royal Jubilee; 5, Wellington. (F.).—1, *Mère de Ménage*; 2, Bow Hill Pippin; 3, Golden Reinette; 4, Beauty of Kent.

## Pigs: Feeding and Breeding.

The pig is, or rather has been, looked upon as the inferior animal of the farm. That he is at the present moment is very doubtful. We can remember the time when, with good grain at 1s. 6d., and offal at 1s. per stone, pork at 7s. 6d. was considered by farmers a product to be avoided except in case of necessity. At the present time pork is worth from 6s. to 6s. 9d. per 14lbs, not a very serious reduction in price from

that of thirty years ago. But when we consider the value of pork-producing foods, what a difference we find. Meals which then cost 1d. per lb can now be bought for 9d. per stone, a reduction of 40 per cent.; whilst in too many cases farmers have on their hands quantities of unsaleable corn, which only requires grinding to provide excellent food for the pigs. Then there are enormous quantities of Potatoes which are damaged by disease sufficiently to spoil them for market purposes, but are almost as good as the best for pig food. We doubt whether in the history of modern farming there has been a time when good pig food was so plentiful, or such an excellent opening for the pig feeder.

There is no question about the folly of selling well-grown, but damaged Barley at 18s. or 20s. per qr, if pigs can be found to turn it into pork. We once tried an experiment with a number of pigs with a view to ascertaining the return per ton for the use of sound Potatoes of small size and low quality. We steamed a quantity of these Potatoes, and used with them a mixture of bought Wheat thirds, and home-grown offal barley meal, charged at the same price. After charging all labour and expenses, the balance left to credit of the Potatoes amounted to 58s. per ton, or 23s. per ton more than they would have realised on rail at the nearest station. The price of pork, too, was rather under than over 6d. per lb.

During the last few years, no doubt the swine fever restrictions have militated much against the extension of pork production in Great Britain, but we hope that these restrictions, vexatious as they are, may soon be relaxed, as the object for which they were framed is fully attained, and that the natural adaptability of this country for the breeding and feeding of swine may receive fuller recognition. The effect of swine fever restrictions has been chiefly to prevent breeding, and for several years, until the present, young pigs have been scarce and dear. During last summer they fell to a comparatively low figure; but they are dearer again, and show every sign of another boom. There is, however, good encouragement to breed from gels of a suitable age; and we advise our friends to do so. There is no better time for sows to farrow than in March or April, and those mated with the boar now would be due during the latter month.

Many people consider that a gelt which is somewhat fat, or as they term it "nice pork is not suitable for breeding purposes." Well! If we wish to produce animals of a thriving nature, we must breed from such, and although there may be some truth in the argument that such animals do not readily produce offspring, we may at any rate give them one or more chances to do so. In case of failure, no harm, but rather good, has been done to the process of feeding, and the use of the boar is not a ruinous item. Amateurs are too easily scared from pig feeding by the cost just at first, of the meal supply. They may be buying in anything but the cheapest market and using far more of this costly commodity than is economically advisable. Of course, pigs vary in constitution as in appetite, and the ration on which one pig would do well and give a profitable return may be quite inadequate for one of quicker growth and larger appetite. In feeding with food of our own production, we have to cut according to our cloth and the main object is the profitable conversion of that food into saleable pork. If we have a large quantity of offal Potatoes and are fortunate enough to have little unprofitable grain, there is no reason for spending good money in purchasing meal. Pigs will feed on Potatoes with very little added meal, though they may be a little longer in the process. A large pig of 300 to 400 lbs. weight, will eat 70 to 80 lbs. of meal per week and many will eat more. But with Potatoes, raw and steamed (*ad lib*), the meal may be reduced to 20 lbs. per week. Many a cottager's pig has scaled 500 lbs. carcase weight, after being fed on Potatoes almost entirely. Steamed Potatoes are given morning and night, and raw Potatoes at mid-day. The steamed Potatoes are well mashed while hot. The allowance of meal is mixed with boiling water and left to stand for some hours before being mixed with the hot mashed Potatoes, and then given immediately to the pigs.

Many pig feeders do not approve of more than two meals per day, for their animals, but it stands to reason that in such case the meals must be heavy ones. These feeders are farmers or their men. The cottager's wife, who has to make the most of her food, prefers to feed oftener, but gives every morsel in a cooked condition and hot. The one point in favour of two meals is the avoidance of disturbance, for the less feeding animals are roused from rest, the better; but the pig, greedy a feeder as he is, has only a limited capacity of stomach. Is a term of 12 hours too long a time for the stomach to go un replenished? If the food be highly concentrated, perhaps not; but if as in the case

of the cottager, the food be limited (more in quality than quantity) then is it necessary to feed oftener, and the virtue of frequent and hot meals may become a necessity.

### Work on the Home Farm.

Although there has been little rainfall lately, the surface of the land is still moist and sticky, and ploughs do not run cleanly; yet we are inclined now to tackle all the arrears which can be made up, for we notice that the land dries much more rapidly after being moved, even though the ploughing may have been done under difficulties.

We have never had such a large breadth of cleared Turnip land requiring ploughing as is before us now. We have always made a point of keeping the plough moving as close as possible behind the sheepfold; but circumstances have this season intervened and prevented us. Now, however, there is an opportunity, and the work will be taken next. We shall plough with the ordinary swing plough, and take a 9in furrow 5in deep.

The corn trade has been so slow lately that since November little threshing has been done, and few waggons are seen on the roads with loads of grain. The contrary is the case, however, with Potato delivery. A considerable quantity is now being moved on to rails, and it is fair to suppose that the markets are strengthening. Our experience shows that the Potatoes are keeping fairly well, but nevertheless the quantity of sound tubers is small compared to the quantity we have to discard, and after every effort has been made, the buyer is constantly complaining of bad sorting.

The boom in Northern Star, &c., has had a lull, or rather it has been eclipsed by the boom of Eldorado. Next year's crop of this Potato for November delivery has lately been booked at 40s. per pound. Within a week the demand has been such that the price has risen to 50s., and now to 60s., with every likelihood of going to 100s. Veritably, wonders never cease!

The fat stock markets are over, and our local ones have been most successful. The quality of the animals has been of all-round excellence, the numbers large, and prices quite satisfactory. Some of the best beef made 7½d. per pound, and pork sold well. Six shillings for 14lb was easily obtained for the largest pigs up to 600lb dead weight.

Many gates between fields are of no use during winter, and are better brought home and put in a shed. If they are dry enough they may be painted ready for rehanging when required. Black varnish is a good substitute for paint, and the work can be done during wet weather, and find occupation for otherwise idle hands.

### The Potato Boom.

Some further remarkable prices have been realised for a few pounds of Potatoes. On December 11, at the Lincoln market, a local firm disposed of 7lb of Eldorado Potatoes for £700, or at the rate of £224,000 per ton. The purchaser afterwards resold part at £150 per pound, which is more than double their weight in gold.

### The Manurial Experiments at Alfreton.

Professor Blackshaw, of the Midland Agricultural and Dairy Institute, has just concluded interesting manurial tests at the Shirland Lodge Farm, near Alfreton. The tests were made to determine the value of artificial and farmyard manures in the growth of Swede Turnips, and which was the most economical and productive for the farmer. In no way have the experiments been carried out to disparage the use of farmyard manure, but to enable the farmer to be progressive, to keep abreast of the times, and economise. In all thirteen plots were experimented upon, and it is clear from two instances where no manure of any description was applied that crops must have a fertiliser, and some forcing power. The plots covered one-twentieth of an acre, and the plot which was dressed with 4cwts of superphosphate produced fourteen tons 17cwts 16lbs of Turnips per acre. The plot dressed with 1½cwts of nitrate of soda and 4cwts of superphosphate produced 19 tons 5cwts per acre, while with an equal quantity of these elements and 2cwts of kainit only 18 tons 18cwts 2qrs 8lbs per acre were produced, thus showing apparently that kainit was of no value at all. A double quantity of these ingredients raised 22 tons 3cwts 2qrs 8lb per acre, which again proportionately proves the uselessness of kainit on the experimental land. Fifteen loads of farmyard manure produced 16 tons 19cwts per acre, while ten loads produced about 1cwt per acre less. The same quantity with assortments of artificial manures increased the production by as much as four and five tons per acre. Estimating the cost of the various manures on the plots, the plot containing superphosphate alone seems to have been the most economical, and the most productive, proportionately speaking. At the same time it was stated to be clear that farmyard manure is still a serious rival to the artificial dressing.

THURSDAY, DECEMBER 31, 1903.

**Chrysanthemum Analysis.**

NCE more it is my pleasure to  
present to the readers of the  
*Journal of Horticulture*, by the  
kind and willing aid of those  
qualified, an up-to-date selection  
of Chrysanthemums on a more  
comprehensive scale than in some  
years past. No less than forty persons  
are taking part in this election, every  
one of them exhibitors of the present year.  
If this note should catch the eye of any person  
who has in the past kindly assisted in this  
audit, and who is not now an exhibitor, he will  
readily understand why I did not include him.  
From numerous letters received, some a long  
time before the time to issue invitations, asking  
when the audit was to take place, and hoping  
it would, I am convinced that Chrysanthemum  
cultivators generally appreciate this yearly  
analysis.

To make the selected list of varieties more  
comprehensive and useful, I have added, as  
briefly as possible, the colour of each; as those  
who are not conversant with the varieties, and  
have not an opportunity to visit the leading  
shows, desire such information in making a  
selection of varieties for the coming season in  
as concise a manner as possible. If some  
persons should think the colour descriptions  
hardly sufficient in some varieties, he will  
understand that brevity has been the main  
object in that particular.

Mainly in the past the balloted lists have  
been confined to Japanese and incurved  
varieties. This time, to make the selection  
more useful to that body of cultivators who  
desire Chrysanthemums, but not in an exhibi-  
tion sense, I have attached selections of  
other sections, such as decorative varieties,  
single-flowered and pompon kinds, so that  
such cultivators in ever so small a manner  
cannot say that this yearly audit is confined

READERS are requested to send notices of Gardening  
Appointments or Notes of Horticultural Interest,  
intimations of Meetings, Queries, and all Articles for  
Publication, officially to "THE EDITOR," at  
12, Mitre Court Chambers, Fleet Street,  
London, E.C., and to no other person and to no other  
address.

to the exhibitor alone I am positive that those who cultivate Chrysanthemums in a decorative sense—small blooms—are distinctly on the increase. For this reason I am sure the *Journal of Horticulture* will open its pages for the benefit of those enthusiasts.

As showing the decline in the incurved section, but twenty-three persons—a trifle over half—sent in returns for this type. This fact may not be pleasant reading to those who are so enthusiastic over the incurved flower, but it is a distinct proof of how their value is regarded as compared to the more showy Japanese varieties.

Notes on the Japanese section.—To obtain fifty of the best varieties no fewer than one hundred and ninety-seven names are given, which is a distinct proof of the wide range of opinion held by the forty electors. Although it is a large number it does not cover quite so wide a range in proportion as last year, when twenty-seven voters named one hundred and fifty-seven sorts. Again, the year before sixteen voters gave one hundred and fifty-two varieties. For the year 1900 in obtaining a list of sixty varieties two hundred and thirty-one names were given by the thirty-three persons who took part. This time I only give the names of those varieties that obtain five votes, thinking no good purpose would be served by adding all.

As in last year W. R. Church heads the list with a full number of votes, showing what exhibitors generally think of this variety, which is a distinct compliment to our Australian friends. It is somewhat strange that this one variety only should receive the full complement of votes and not one variety that has thirty-nine. Mrs. Barkley and Mrs. G. Mileham tie for second place, both good types of Japanese flowers. These two maintain their position in a steadfast manner. As was to be expected, F. S. Vallis has this season taken a strong lead; from nineteen votes last year it has now secured thirty-seven, a position it richly deserves. By the majority of Chrysanthemum cultivators it was considered to be a "Vallis" year. Its co-partner, Madame P. Radaelli, has been exhibited remarkably well, and secures a prominent position. No fewer than four varieties tie for the third place. No one will dispute the good quality of either, all combine the points that go to make Japanese Chrysanthemums popular, viz., size, form, colour, and general quality, without the slightest tendency to coarseness.

A similar remark applies to the following five varieties which receive an equal share of votes. One and all are desirable types, especially Bessie Godfrey and Miss E. Fulton. The former has well maintained the high position it won last season, while the latter is, perhaps, one of the best types of an incurved Japanese bloom.

Australie has dropped from the second place of the last two years to the sixth in the present list. Even its best adherents must admit it has had a good innings. That charming white flowered variety, Mrs. J. Lewis, exhibits a similar weakening, falling to the eighth position. Nellie Pockett has fallen from the third to the tenth place, while Miss Alice Byron has shared a very similar fate if not quite so decisive, perhaps. Godfrey's Pride has doubled its number of votes, which speaks for itself. Florence Molyneux has dropped from the second position last year to the twelfth this, an ominous sign for this English raised variety. Mons. Chenon de Léché is dwindling in the support it receives. In the list of 1901 it was equal with the highest; last year it dropped to the fourth place, while this season it sinks nine votes deeper.

Le Grand Dragon just succeeds in its inclusion in the fifty selected, while last year it was but seven votes from the top; the year before it was equal with four others for the premier place. It cannot be said that Miss Mildred Ware has progressed as well as its friends could have wished, it only gets within the select list by one vote. An almost similar remark applies to Edwin Molyneux. This still grand variety in some hands has lived long, much longer than any other variety, and has enjoyed great popularity. It is now but natural to think, like all others, it has in a general way seen its best days. It does seem strange, too, to think that from the many thousands of seedlings from it not one is like it in colour. C. J. Warren, Calvat's '99, Loveliness, Mr. J. J. Thornycroft, and Mrs. Coombes have quite fallen out of favour—the latter this time obtained but five votes. Queen Alexandra but eight, Pride of Madford and Ben Wells but eight, Vivian Morel, Lady Hanham and Edith Tabor are distinctly low. Charles Davis, Mutual friend, and Henry Barnes each receive three votes. The

once popular Phœbus, Simplicity, Madame P. Rivoire, and Graphic are only named twice. While Madame A. Chatin, Godfrey's Masterpiece, Swanley Giant, Mons. Hoste, W. H. Lees, Eva Knowles, Mrs. E. W. Clark, and fifty-three others have but one solitary supporter.

#### VOTES FOR THE BEST FIFTY JAPANESE.

- |   |  |
|---|--|
| 40. W. R. Church, rosy crimson, bronze reverse                | 18 Mrs. F. W. Vallis, crimson, shaded apricot yellow |

#### NOTES ON THE INCURVED SECTION.

To obtain thirty-six varieties one hundred and fifteen names are given as compared to one hundred and eight last year, and ninety-eight the year before, which is a proof of the wide range of variety prevailing in the minds of the electors. Speaking generally, the selection from present day varieties is a good one. The sorts that did duty from fifteen to twenty years since are quite obsolete from the present selection. The present list does not contain a single variety that was constantly to be met with in the exhibition room ten years since. This is, in my opinion, a proof of how the constitution of varieties decays, some much more quickly than others. With but a few exceptions the present list of three dozen varieties are really good types of the incurved section; they may not possess, perhaps, all the characteristics that were deemed necessary by the hard and fast florist of twenty years past. In those days where one variety was introduced as a seedling we have now twenty, and the bulk of them obtained by intercrossing with Japanese varieties with a view to improve the colour which in the incurving section is admittedly not so bright as in the Japanese. This intercrossing then of two types or sections cannot but affect form and contour to a considerable degree. What we now gain in size we lose in formation. The globular shape is not nearly so frequent in new sorts as it was. It cannot be said either that the constitution of present day varieties is at all equal to those raised from fifteen to twenty years since. The oldest variety, James Agate, in the present selection does not date further back than 1894; C. H. Curtis was introduced a year later, whereas the first of the Queen family dates back as far as 1847.

As for several years past C. H. Curtis and Duchess of Fife have headed the poll, they still retain that position in company with Lady Isobel and Ialene. Frank Hammond still maintains the place high up in the list which its quality entitles it. Hanwell Glory and Miss Nellie Southam still are not deposed. Mrs. R. C. Kingston has fallen from the third to the sixth place in the list. Last year four members of the Queen family found places in the thirty-six; this year there is not one. John Lambert, Lord Alcester, Empress of India, and Golden Empress receive respectively eight, seven, six, and five votes from a possible twenty-three, which is a distinct proof of the wane in popularity of this section. Not one member of the Princess family is to be found with more than four votes, the type, Princess of Wales, receiving but three; no less than thirty-five obtain but a solitary supporter. President Bevan is one of these, which is a plain proof what electors think of the variety. I always maintained it should be classed with the incurving Japanese section. A few more eliminations of this kind would do much towards raising the standard of the incurved section. Mdle. Laurence Zédé has at last disappeared from the list, and so have all the members of the Rundle family. Prince Alfred and Lord Wolseley have at last vanished, having done service for thirty and twenty years respectively. Princess Teck and her numerous sports are never heard of now, although in the eighties they could not be done without. There is no doubt the decline in the incurved Chrysanthemum is largely due to ill selection,

imperfect representation of varieties, and their inability to cope generally in decorative value with their more showy compeers—the Japanese kinds.

#### VOTES FOR THE BEST THIRTY-SIX INCURVED.

- |  |  |
|--|--|
| 23 C. H. Curtis, rich yellow                         | 12 Pantia Ralli, bronzy buff                     |
| 23 Duchess of Fife, white, shaded blush              | 11 Mrs. W. C. Egan, lilac pink                   |
| 23 Lady Isobel, lavender blush                       | 11 Louisa Giles, rich golden yellow              |
| 23 Ialene, rosy violet                               | 10 General Symonds, orange buff, shaded bronze   |
| 22 Frank Hammond, rosy bronze, yellow centre         | 10 Miss V. Foster, silvery violet                |
| 22 Miss Nellie Southam, deep rose purple             | 10 Countess of Warwick, white, tinted purple     |
| 22 Hanwell Glory, deep bright bronze                 | 10 Egyptian, deep velvety red                    |
| 22 Mrs. H. J. Jones, white, tinted rose              | 9 G. W. Matthew, soft amber                      |
| 20 Ma Perfection, pure white                         | —26  |
| 20 Mrs. F. Judson, white                             | 8 Mildred Lyne, fawn, shaded bronze              |
| 19 Madame Ferlat, white                              | 8 John Lambert, buff, shaded rose                |
| 19 Topaze Orientale, pale yellow                     | 8 George Haigh, rosy earmine                     |
| 19 Charles Blick, rosy violet on a white ground      | 8 Edith Hughes, white, lined purple              |
| 19 William Higgs, golden buff                        | 7 Perle Dauphinoise, yellow, tinted bronze       |
| 18 Ralph Hatton, purple lilac                        | 7 Miss D. Foster, silvery mauve                  |
| 18 Fred Palmer, blush pink                           | 7 The King, rich lake, silver reverse            |
| 17 Mrs. C. Crooks, white                             | 7 Lord Alcester, primrose                        |
| 17 Globe d'Or, yellow, tinted bronze                 | 6 Empress of India, white                        |
| 17 Mrs. R. C. Kingston, soft lilac pink, lined white | 6 Mrs. Bernard Hankey, chestnut, suffused red    |
| 17 Pearl Palace, white shaded pink                   | 6 Major Bonnaillon, clear yellow                 |
| 15 Nellie S. Threlfall, white                        | 6 Nellie Stevens, carmine rose, flushed cinnamon |
| 15 George Lock, chestnut crimson                     | 6 Mrs. W. Higgs, silvery pink                    |
| 15 Miss E. Seward, deep yellow, lined reddish brown  | 5 Mary Phillips, rose base, yellow centre        |
| 15 Chrysanthemiste Bruant, rosy buff                 | 5 Mrs. E. Bennett, rosy pink                     |
| 14 Robert Petfield, silvery mauve                    | 5 Ernest Cannell, deep fawn                      |
| 14 Mdle. Lucie Faure, creamy white                   | 5 Golden Empress, golden yellow                  |
| 14 James Agate, white                                | 5 Bonnie Dundee, orange bronze                   |
| 13 Miss Annie Hills, silvery flesh pink              |  |

115 varieties.

#### VOTES FOR THE BEST TWELVE NEW JAPANESE OF 1902-1903.

- |  |   |
|--|---|
| 27 Miss Mildred Ware, deep rosy cerise               | 8 Maud du Cros, pale straw, yellow in the centre      |
| 24 Mrs. F. W. Vallis, crimson, shaded apricot yellow | 8 Alfriston, crimson purple                           |
| 22 Henry Perkins, reddish crimson on yellow ground   | 8 Lord Hopetoun, crimson                              |
| 19 F. S. Vallis, canary yellow                       | 7 Donald McLeod, apricot yellow, shaded crimson       |
| 19 George Penford, crimson scarlet                   | 7 Mrs. A. R. Knight, rich orange yellow               |
| 16 Miss Olive Miller, pink                           | 7 J. H. Silsbury, bright terra-cotta, suffused yellow |
| 14 Lady Couzens, rosy pink, silver reverse           | 6 Captain Percy Scott, deep yellow                    |
| 11 Bessie Godfrey, canary yellow                     | 5 Florence Penford, lemon yellow, chrome reverse      |
| 10 Lady Cranston, white, flushed rose                | 5 Miss Stopford, white                                |
| 10 George Mileham, deep rich crimson                 | 5 Countess of Arran, creamy buff, shaded pink         |
| 10 W. Duckham, pale mauve                            | 5 Beauty of Leigh, buttercup yellow                   |
| 9 Mrs. J. Dunn, white                                | 5 Mary Inglis, terra-cotta, on fawn ground            |
| —12  |   |

84 varieties.

#### NOTES ON THE NEW JAPANESE VARIETIES.

The interest taken nowadays in the introduction of new and desirable varieties is so keen that I thought after a lapse of a few years it would be wise to again add this section to the audit. To obtain a selection of twelve varieties no fewer than seven dozen names are given, which is a proof of the wide range of observation taken by the electors. No one will say but that the first twelve is made up with an extremely fine collection of novelties, embracing a wide range of colour and maintaining the desired form of flower as well as petal. Several varieties just miss the distinction by a narrow margin of votes, although they possess all the qualities desirable. In many of these instances it is purely a question of want of opportunity to be seen more widely. As they will be in the hands of so many capable cultivators during the next season they will, no doubt, make their mark in 1904. Miss Mildred Ware easily secures the leading place with twenty-seven votes; the smallness of this number is explained by so many electors not wishing to take part in this part of the audit owing to a want of opportunity to see the various new varieties—a commendable desire too. That charming variety, Mrs. F. W. Vallis,

occupies a position—second—quite in keeping with its quality; no doubt it will depose the previously named variety after another season's trial. Lady Cranston, although coming out late in the season, was sufficiently seen to warrant its inclusion in the best twelve. That lovely white, Mrs. J. Dunn, obtains the coveted position which is just missed by Maud du Cros, a variety that has only to be seen to be admired. J. H. Silsbury and Beauty of Leigh also suffer in that way. No fewer than thirty-one varieties are named but once, thirteen receive two votes, twelve three. I think it will be generally admitted that there is a distinct shortage of what are known as new and desirable kinds outside of the select few as compared to some years. Raisers and cultivators exercise a greater supervision than formerly. A variety to make headway must have distinct points of excellence. A greater tendency to quality instead of mere size characterises the bulk of new kinds in any section.—EDWIN MOLYNEUX.

#### THIRTY SINGLE FLOWERING VARIETIES.

Earlswood Glory, pure white; Earlswood Beauty, primrose; Edith Pagram, rich pink; Captain Allsop, rich yellow. Mrs. G. W. Forbes, rich purple maroon; Felix, terracotta; The Bride, pure white; Elsie Neville, crimson, terracotta; Kate Williams, yellow.

Jane, pure white; Lady Windsor, deep lilac; Miss Mary Anderson, blush white; Miss Annie Holden, pale yellow; Mrs. D. B. Crane, cerise pink.

Purity, pure white; Rev. W. E. Remfrey, crimson maroon; Oceana, peach blush; Sir Geo. Bullough, deep yellow; Star of Honour, white, cream centre.

Ewan Cameron, blush white; Thomas Suter, white, yellow disc; Princess of Wales, flesh colour, white ring at disc; Mrs. Henry Herbert, pure white.

Framfield Beauty, deep rich velvety crimson; Miss A. Edwards, white, flushed rose; Glorious, rose, base of petals white; Belle of Weybridge, rich chestnut crimson; F. W. Smith, rich glowing pink; Josephine H. Stallard, crimson red; Mrs. E. Roberts, lilac.

#### TWENTY-FOUR POMPON VARIETIES.

William Westlake, golden yellow; Rosinante, blush rose; Mrs. Bateman, orange brown; Mr. Sabey, bright golden yellow; Nelly Rainford, buff; Mdlle. Elise Dordan, silvery pink.

Madame Marthe, pure white; Golden Madame Marthe, golden yellow; La Purété, white; Comte de Morny, purple; Black Douglas, dark crimson; Pygmalion, deep rose.

President, dark rosy crimson; Marabout, blush; Tous-saint Maurisot, rosy lilac; St. Michael, bright gold; Lizzie Holmes, canary yellow, tipped rose.

Adele Prizette, rosy lilac; Prince Victor, dark maroon; Osiris, rosy pink, edged gold; Klondike, bright yellow; Miss Ada Williams, white shaded blush; William Kennedy, crimson; Gallia, clear soft pink.

#### EIGHTEEN ANEMONE-POMPON VARIETIES.

Aglaia, blush white; Antonius, bright yellow; Madame Montels, white, yellow centre; Madame Chalonge, blush, tipped sulphur; Marie Stuart, blush, sulphur centre; Reine des Anemones, pure white, late.

Bessie Flight, rosy lilac; Briolis, rosy blush; Emily Rowbottom, white; Jean Hatchette, white, pale yellow centre.

Grace Darling, blush; Calliope, ruby red; Marguerite de Coi, blush, yellow centre; Mr. Astie, golden yellow; Meteor, crimson, scarlet and gold; Madame Sentir, pure white; Magenta King, magenta guard, yellow disc; Gem of Earlswood, citron.

#### TWELVE LARGE FLOWERED ANEMONE VARIETIES.

Lady Margaret, pure white; Gluck, orange yellow; Fleur de Marie, white; Acquisition, rosy lilac, yellow centre; Delamare, creamy white; Descartes, bright crimson red.

Mrs. Judge Benedict, sulphur, tinted blush; Mrs. P. R. Dunn, pure white; Mdlle. Nathalie Brun, cream, tipped primrose; M. C. Lebocqz, citron yellow, tinted rose; Prince of Anemones, lilac blush; Miss Annie Lowe, primrose yellow.

#### TWELVE JAPANESE-ANEMONE VARIETIES.

W. W. Astor, salmon blush, centre golden rose; Mrs. H. M. Gardner, deep rose, tipped gold; Nelson, crimson purple; John Bunyan, rich yellow; Jeanne Martz, blush white, lilac disc; Sir Walter Raleigh, pale blush.

Madame Lawton, white and rose; Clara Owen, pale straw; Mrs. Bassett, lilac guard, yellow disc; Marsia Jones, pure white; Fabian de Mediana, lilac, purple and gold; Halcyon, pure white, extra large guard florets.

#### TWENTY-FOUR LATE FLOWERING VARIETIES.

W. H. Lincoln, orange yellow; L. Canning, white; Lord Brooke, bronze and yellow; Princess Victoria, creamy white; Tuxedo, terra-cotta bronze; Framfield, pink, rich pink; Etoile de Feu, brilliant red; Queen of the Exe, soft lilac pink.

Mrs. J. Thompson, chestnut bronze; Niveus, pure white; Red Lady Carey, bright red; Miss Anna Hartshorn, pink and white; Etoile de Lyon, lilac rose, shaded silver; Mrs. Alfred Tate, terra-cotta and gold.

The Queen, pure white; Sunstone, straw yellow; Madame Phillipe Rivoire, white; Miss J. Cottee, golden yellow; Lady Osborne, soft flesh pink.

Madame Edmund Roger, greenish white; King of Plumes, yellow; Progne, amaranth; Yellow Mrs. Thompson, yellow; Red L. Canning, dark red.

## The "Daffodil King" on Tour.—No. 12.

(Continued from page 573.)

Again the scene shifts—this time to New Caledonia, which is a French convict establishment. The vessel had a quantity of coals to discharge here, which work occupied the greater part of a week, so that there was ample time to see the sleepy township, Burpos, and its neighbourhood, so far as strangers were permitted. The natives are not allowed to enter the town, and no prisoners are to be seen, except a few aged men who sweep the streets in the mornings. Soldiers in uniform were not to be seen, but at a café Mr. Barr met some officers in civilian dress. Our narrator says there is evidently a good deal of secrecy with this establishment, and he thought it would be well for the Australian Government to keep an eye on this French possession.

The place is strongly fortified, fortifications being placed on every point of vantage, so that, should there ever be a quarrel between France and Australia, the taking of all the forts would mean a very severe struggle.

From New Caledonia the ship sailed for the New Hebrides, calling en route at various islands to discharge cargo and missionaries. Mr. Barr was now within a few hundred miles of the Fiji group (which are even on a lower latitude), where he had voyaged not long previously, as these notes have shown. The tour to those of us who must content ourselves at home, seems a remarkable one, and gains in interest the further we trace it.

When off the island of Malokula, the passengers who desired to land and see the largest active volcano in the world were limited to six persons, as the natives have the reputation of being "man-eaters." The party applied to the mission station on landing for a guide; and the missionary tried to induce one or more of his people to accompany the explorers, but they one and all positively refused, as a war was then raging in the different villages. Later, however, after some further persuasion, one man consented, and at the first village the party was greeted by a sentry armed with a musket. No harm came from this source, and soon the head-man of the village was interviewed, and successfully, as it would seem, for he sent the sentry with Mr. Barr and his companions. They ascended to as near the mouth of the crater as possible, but not so close as to be able to look down upon the mass of burning lava.

Entering a second village, the party was taken in hand by another convoy, and so on from village to village, finding in most places men who could speak English had been to Queensland, at the sugar plantations. At the last village in the journey they were told that there were some English traders on the coast, and having requested to be taken to them they found two men (fortunately for the latter) who belonged to their own vessel, having come all the way from Sydney. Having refreshed themselves, the party set to work, and with the aid of a native crew they were soon back at the steamer, which they reached at four o'clock in the morning. They had been away twelve hours on a journey that ought only to have taken four hours. The captain was greatly rejoiced to welcome them back, as he had begun to despair of their returning.

The members of the vessel must have been real coral-island adventurers! Much climbing was done on Malokula, and on one occasion it was necessary for the natives to assist. Mr. Barr was being hauled and pushed up a steep place by means of a rope, when the head-man of the village, evidently feeling over-worked, exclaimed, "What for you bring this old fellow man up here?" Mr. Cheesman, the Melbourne nurseryman, who accompanied the veteran on this tour, was wont to call out "Cocoanut," when the natives procured for him green Cocoanuts; and he was able to consume so many that one observant islander was not slow to make an impolite comparison.

(To be continued.)

**Cattleya guttata Prinzi.**

This is one of the most distinctive *Cattleyas* we have, and the markings, as well as the form of the flower, are pleasing. The sepals and petals are delicate creamy yellow, spotted with violet, while the lip is of a bright magenta shade. It is found in a number of collections, while the species itself is well known.

**Phalænopsis Mariæ.**

This Orchid was discovered by Mr. F. W. Burbidge in the Sunda Isles, and bears the name of the discoverer's wife. The flowers (a small raceme of which is illustrated) grow in a lateral, drooping raceme, and are about 1½ in across. The sepals and petals are white, and have transverse bars of chestnut colour. The lip is deep magenta purple, margined with white. Messrs. Veitch were the introducers.

**Notes on Vandas.**

*V. Parishii* is a dwarf, stout growing species bearing large fleshy flowers on erect spikes. In the type these are yellowish-brown, but a higher coloured variety, *V. P. Marriottiana* is far superior. It likes ample heat and moisture. *V. Roxburghii* is the oldest *Vanda* in cultivation, the type species upon which the genus was founded. It is a tall growing handsome plant, bearing towards the top six to eight-flowered racemes of sweetly scented blossoms. These are greenish with lines and spots of brown on the sepals and petals, the lip violet. Fairly large pots or baskets suit it well, and it does best in an intermediate house.

The beautiful *V. Sanderiana* is certainly the finest in the genus, and one of the grandest Orchids in cultivation. In growth it resembles *V. cœrulea*, but the flowers are larger and of great substance. In colour they are rosy-pink, with a peculiar buff suffusion, the centre area crimson. It likes plenty of heat and moisture while growing, must be well consolidated in

**Cattleya guttata Prinzi.**

autumn, and kept in an intermediate house in winter. Small pots or baskets are best, and clean sphagnum and charcoal suffice for the compost. *V. suavis* and *V. tricolor* are noble exhibition plants, easily grown if given due attention. Although

the former named is supposed to be a variety only of the latter, it is the better of the two, the pure waxy whiteness of the segments being far superior to the yellowish tint on *V. tricolor*. They need plenty of head and elbow room, ample moisture both in the atmosphere and at the roots while growing, and an intermediate temperature. For cultural purposes *V. teres* and *V. Hookeriana* may be bracketed. Not every one has the convenience to cut them down and place a compartment entirely to them, and in such cases they do fairly well in the ordinary way, though nothing like the number of flowers will be produced. Although several species have been left out, the above named will make a very interesting and beautiful collection.—H. R. R.

**The Week's Cultural Notes.**

One often feels sorry for *Cypripediums* when in flower and afterwards at this time of year. There are Orchids that grow to flowering time, the blossoms forming the apex, as it were, of the

**Phalænopsis Mariæ.**

season's growth, and that require rest afterwards; but this is not the case with *Cypripedium insigne* and its hybrids, or many of them. At the time the flowers are forming in one set of growths another set is growing, and to stand the plants about in dry, draughty rooms and corridors, and yet expect a good flowering return another season, is going a little too far. Yet this is the fate of hundreds of plants at this time of year.

After a reasonable flowering time the flowers should be removed, as they will still last well in a cut state, and the plants, after a thorough cleaning and overhauling of the compost if this is necessary, should be taken to the growing quarters at once. An intermediate temperature with plenty of atmospheric moisture is what this section likes, and as soon as the roots are really active full supplies of water may be given. This will result in fine growth, with vigorous, healthy leaves and stout flowering crowns. If they rest at all it is in summer, and a few weeks' sojourn in a cool and lightly shaded airy frame is then advisable.

The present is a very trying season for small growing Orchids such as the *Ionopsis* and the smallest growing of the *Oncidium*s, and I am led to speak of these from seeing some pans of the pretty little *O. tetrapetalum* in flower recently. There is so little stamina in them, and our houses, no matter how well constructed, are often draughty, especially near the roof, where such plants are usually grown. When they have obtained a really good hold upon the compost or block there is less risk, as water can be safely supplied; but when, on the other hand, roots are few and weak, there is a danger of losing even these if an extra dose of moisture is given in dull weather.

These Orchids appear to me to relish a dry and wet time every day, rather than a wet and dry season at opposite times of the year. If it could be so arranged, I believe that every one of them would be better for being dry, say from an hour before noon till closing time in the evening, when a light dewing from the syringe would replenish the power wasted and form a restful moist atmosphere around them for the night. But this, of course, is impossible in most cases, and we must do our best by maintaining the temperature as even and regular as possible, and preventing draughts on the one hand and a stuffy heat on the other.—H. R. R.

## Insects as Garden Adornments.

At this season of the year, insect life generally is in a state of repose, waiting for the expansion of the spring buds. Though a few insects there are whose habit it is to make appearance on occasional mild days during winter, some moths, for instance, and sundry species of the fly order. Beetles are nearly all dormant, yet they are amongst the earliest insects to foretell the approach of the growing—often blowing—season. Gardeners, however, in the course of their operations bring beetles into view about this time, turning them over with the soil, shaking them out of autumn flowers, in which they have found a shelter, and disturbing them from their winter quarters under the bark of trees. Many beetles also, during their larva or grub stage, may be found inhabiting solid wood, hollow stems and roots. It is not unusual to see in April some small beetle marching about with dents upon the wing-cases. These have been caused by the pressure upon its body, during the winter sleep, of contracting bark, and come out all right.

Ladybirds, of which we have a number of species, two being specially familiar to us, are beetles that did not have the first half of their name from their ladylike aspect, but because they were presumed to be under the guardianship of "Our Lady." They are small, but pretty insects, and of notable service to the gardener, also sometimes to the farmer, their favourite food being the aphid tribe on all kinds of plants. Probably they also eat some of the Acari or mites, which occasion us trouble at times. So far as we have observed, ladybirds hibernate under bark, amongst dry leaves, in nooks and corners, emerging during spring to start a new brood. We find them, however, active or semi-active, through the winter months in houses and frames, where they doubtless capture little insects that may be about. The commonest species is the two-spotted *Coccinella bipunctata*, the small brown grub, which is even more ravenous than the adult beetle. Next to it in abundance is the larger *C. septempunctata*, so-called, but the number of spots varies; occasionally we notice a specimen that has none.

Like most of its brethren, it exudes a fluid of an unpleasant odour, which had repute as a remedy for toothache. These are useful, and not ugly, but there are prettier ladybirds to be seen in gardens, very serviceable. The eyed ladybird (*C. ocellata*) is generally found on trees; it has red wing-cases, upon which are eighteen black spots, each encircled by a yellow ring. Then another species can boast twenty-two spots, not always countable, and yet another species is sometimes a cream white with black spots or black with spots and streaks of red.

Many of the long-horned beetles, of various sizes, that are active in the summer sunshine, running over leaves or flowers, and climbing stems, are living now as fat, muscular grubs under bark, or in decaying wood. Those of the wasp beetle, or *Clytus arietis*, white, flat, with small horny heads, often tumble by scores out of some old garden post that is being pulled up as useless, because they and other insect borers have reduced it to rottenness. June is the month to see the beetles in full vigour, skipping amongst the foliage, and they certainly have a wasp-like appearance, and go about in a fussy style.

The arrangement of colours is pleasing to the eye, the head and thorax being black with a yellow ring. On the rich brown of the wing-cases are three yellow bands, a spot, a narrow line, and the tips are also yellow, the rather long legs are pale chestnut. Another lively and elegant wood beetle we know only by its Latin name of *Strangalia elongata*; it is very partial to the flowers of umbelliferous plants. It has a long thorax and tapering wing-cases; the colour is pale yellow, chequered with black and brown. Under bark feeds the grub of the handsome beetle (*Edemera cærulea*), of a greenish blue tint, which has remarkably stout hind legs, suggesting a leaping power, which the insect does not seem to exhibit.

One of the chafer beetles familiar to gardeners, if not always known by name, is the June bug, Bracken clock, or "Cocker-bundy," this last being an odd contortion of the Welsh "Cock-y-bundu," it is so called by anglers, who find it a good bait. Its scientific name of *Phyllopertha horticola*, tells us it is a frequenter of gardens, and though in the open it may hide amongst the Fern or Bracken, it attacks the flower or foliage of various plants, and, appearing early, it sometimes damages the buds of fruit trees, while expanding. Its destructiveness checks our admiration of its beauty, yet it is a pretty insect, the head and thorax being of a green tint, the wing-cases reddish brown. The larva is also one of our foes, since it feeds upon the roots of grasses, probably those of the Potato and other garden plants occasionally suffer. Larger and still handsomer is the Rose beetle, another of the chafers which haunts flowers, especially those of the Privet and Rose, but it does not seem to cause damage, like the preceding species.

This beetle (*Cetonia aurata*) is of bright golden green, adorned with white streaks on the wing-cases. As it flies it produces a humming sound, and it is the habit of the species to assemble in parties, when the sun is shining. It is curious that the grubs are sociable, too, being found sometimes by scores

on decaying trunks or roots. We once noted the occurrence of numerous beetles in a market-garden, which indicated that the grubs had fed on something there. They grow very slowly.

Besides the troublesome beetles, of which there are many handsome or plain, that we must now pass by, we have our friendly species, that are working actively for our benefit a good part of the year. Both in the larval and mature state the ground beetles are carnivorous. The black and muscular larvæ are feeding now underground, seizing a variety of insects, amongst them the wireworm; they also eat small worms, so that it is well not to kill them, if they are known to us. Early in spring, the beetles are abroad, they have no wings, but are very agile in running, with digging powers, too. An abundant garden species is *Carabus monilis*, it has a copper-hued thorax and metallic green wing-cases, which are adorned by little ridges or points, which suggested the name. The sun beetles, particularly of the genera *Amara* and *Pœcilus*, hide amongst clods and stones during winter; mostly they are of bright colours. It is considered unlucky to kill one, and they are useful, though some of them are guilty of attacking ripe Strawberries. Gardens having grassy spots and shady nooks may be found in summer or autumn musical with the sounds of crickets and grasshoppers; not unpleasant to most people. One amusing circumstance is that the chirp or call is not easily traceable to the direction from which it comes. Just now insects of this tribe are mostly in their early stage of life—silent, and probably torpid.

These insects, the crickets especially, exhibit to us Nature's violin, for in the wings we see the bow, string, and sounding-board, variations in the notes of different species arising from the size or shape of the ridge, which is the bow, and that of the drum or sounding-board. The elegant great green grasshopper is the largest, the handsomest, if not the loudest of our British species of the tribe. Leaving copses and hedges its chief resorts, this insect will come into garden precincts, perhaps for a change of diet. Though it is a feeder on leaves, the willingness it shows to eat bits of raw beef when in captivity makes us surmise it may sometimes devour other insects. It is full 2 in in length, with long antennæ, and is of very beautiful green colour, which fades when the insect dies. A small brown species of grasshopper is not uncommon about gardens, occasionally jumping upon some by-passer.

Sometimes a party of field crickets settle in a garden, where they find a dry bank having rather loose earth, in which they can excavate their burrows, often a foot deep. Each insect sits during the day at the opening of its burrow and chirps, coming forth to feed after sunset. It is not unusual for a field cricket to enter a house, and I am inclined to think that the house cricket occasionally goes out into the garden when the weather is warm.—ENTOMOLOGIST.

## A Commendable Method of Teaching.

In pursuance of his duties as instructor in horticulture to the Cornwall County Council, Mr. C. Hott has commenced the practice of taking parties of gardeners and others interested in gardening to private places, and there lecturing on the various features while moving through. Of course, permission is first obtained. Recently at The Rookery, Marazion, he described the success which had attended the fruit culture in connection with the technical gardens at Gulval; and what had been done there could be done at Marazion, where the climate and soil were most suitable to the production of the best results in fruit growing. The selection of trees was treated, practical demonstration being given in tree planting, and the lecturer's remarks on pruning were more fully explained by the effective use of the pruning knife. Air and light were great factors in the proper development of healthy, fruit-bearing trees; under no circumstances should strong dressing be added to newly-planted trees, and damaged roots should be removed before planting by being cut back. Proceeding to the fine Peach wall, the lecturer dealt exhaustively with the planting and pruning of Peach trees, pointing out the advantage of summer pruning for fruit-bearing purposes. The lecturer also dealt very effectively with the selections and culture of Potatoes, remarking that he regretted that in Cornwall so little attention was given to the growing of late Potatoes. There ought to be sufficient good quality Potatoes grown in the county to supply the county. This could be well and lucratively accomplished. Attention was then drawn to the advantage which market gardeners would derive by the cultivation of Asparagus, which crop is inexpensive, but very profitable as well as continuous, requiring very little attention, and when once planted would continue for forty or fifty years. Peas were next dealt with, the lecturer expressing himself favourable to the Marrowfat type; and for dwarfs, his own preference was for William Hirst, Crosley Gem, Sherwood, and British Queen. The lecturer concluded with an eulogy as to the splendid condition of the gardens, which reflected greatly on the skill of Mr. Matthews, the head gardener, and his assistants.

### Trade v. Private Exhibitors.

On seeing a catalogue of Chrysanthemums sent out by a prominent Wiltshire grower, it struck me as rather remarkable that such men were allowed to enter into competition with private gardeners at the various exhibitions held up and down the country. I do not know what the feelings generally are with exhibitors in this respect. Personally, I think it is entirely out of order.—FAIRNESS.

[Such matters entirely depend on the rules and wording of the schedules. If these do not specifically debar the Trade, then must the private gardener be prepared to encounter the commercial growers, and if they can be beaten, as they sometimes are, then the private man wins the greater honour.—Ed.]

### Violets, Princess of Wales and La France.

That Princess of Wales takes up a great deal of room (as stated on page 554), and that we should prefer smaller leaves and shorter leafstalks, which would allow us to get more plants into the frames, has long been recognised by Violet growers. I therefore, for one, welcomed La France as being just what was wanted in this respect, and during the winter before last tested it against Princess of Wales. The result was that I was able to get a third more plants of La France into a frame than I could of the other; but as Princess of Wales, even then, produced decidedly the greatest number of flowers per frame during the winter, I have discarded La France.—W. R. RAILLEM.

### Mealy Bug v. Hose.

This loathsome "insect," such a degrading and dreaded pest to the gardener, cannot easily endure the force of cold water drawn from the hydrant and passed through small bore hose pipe. But it might be said the mealy bug is that insidious, resourceful sort of insect that even with the hose pipe turned on his haunts it will evade some of its cold force. Many a young gardening probationer has spent hours of uninteresting labour on an effort to rid vines and plants from mealy bug, and many times it would seem to him impossible for even a stray insect to remain in possession. Disappointment has awaited many after a short lapse of time to find the old enemy still in evidence, demanding further retaliatory measures to be taken to combat him. Mr. Nash, so long and so honourably associated with Badminton, once assured me that the hose, with plenty of water force, would he hoped be to him a "haven of rest" from the constant worries bug had given him in his vineries in the past. The water supply prior to this date had been totally inadequate, and local in its source; but since water is now laid on from a company's mains, to use his own words "Conveying a force sufficient to drive all the glass out of the roof sashes," he became fully convinced that the mealy bug had but a short life allotted to it at Badminton.

Calling on Mr. Rye, Captain Belfield's gardener at Frenchay, more recently, I found further proof of the efficacy of the hose pipe, and in this instance repetition with cold water alone maintains freedom from infestation. Mr. Rye is a successful grower of specimen stove and greenhouse plants, and among these necessarily Crotons occupy a due prominence. With a mixed collection of plants, and some of them of tender foliage, it needs no stretch of imagination to remember or to understand that all cannot be dealt with on similar lines, hence plants once clean may soon be infested by stock that affords cover, because the delicate nature of their leaves demands individual treatment.

Periodical "bouts" with the hose is made on Crotons of all sizes, and particularly the large specimens. These are taken down from their elevated stations, carried outdoors, and laid on their sides, and the cold water bath zealously applied at every angle. This is even continued into the winter and spring seasons, choosing, of course, a sunny or mild day for the work. Heavy though the work is, it is infinitely preferable to sponging, which must be extended over such prolonged periods. The hosing can be carried out in a few hours, and the extirpation of the mealy bug may be felt to be assured for a time without any further expenditure of labour or material. Roof-trained Stephanotis are another fertile source of mealy bug, and providing the roots and soil can be protected from the cold water deluge, and other plants growing beneath removed for the time, the hose may do as useful execution in the case of these as with

Crotons. High water pressure, however, is the one desirable element, it matters not whether the water be hot or cold so long as there is the continuous and forcible stream to play on the insects from every possible direction. Needless to say it is only hard-leaved and hard-stemmed plants that submit to such drastic measures.—W. S.

### Ailantus as a Town Tree.

The Ailanto, or *Ailantus glandulosa*, of which some 250 specimens are about to be planted in Kingsway and Aldwych, is a Chinese plant which is very hardy in England, and will probably be able to survive even the smoky atmosphere of London. It is largely used as food for the Ailantus or Cynthia silkworm, and is as ornamental as it is useful. It is a stately tree, with a straight trunk and magnificent foliage, the leaves being often more than three feet in length. The Russian Government has planted a number near Odessa, and it appears to be the best tree for growth on the steppes. In France it is used as a timber tree, thriving on chalky soils. Probably no better choice could have been made for beautifying two of the finest streets in London or the world. Nevertheless, at certain seasons it gives off a most loathsome odour. It is to be hoped that the L.C.C. will consider this point before committing themselves to what would be a public nuisance. The name of the plant is not formed from the Greek, as one is tempted to think: it is an approximation to the original Chinese name. Owing to the odour referred to, no insects infest it.—F.

### A Critique on New Potatoes.

As a Potato grower in a modest way, I agree with Mr. J. A. Simpson (page 400) that "The Factor" is a first class variety; but on my heavy soil the past season tried it sorely, and my crop was diseased more than it would have been. On other points it compares most favourably with any high priced novelty, and it would not be out of the line to say that it, along with Evergood and Sir J. Llewelyn are the best for the garden. Respecting the remarks of your Home Farm correspondent (pages 409, 410), I may say that according to my tests the Northern Star by no means equals Mr. Findlay's previous sorts. Royal Kidney is a remarkably productive variety, equalling Evergood in that respect, although it showed about 10 per cent. of disease against Evergood's naught. In quality, however, it surpasses Evergood, being beautifully mealy, and requires less cooking. As to Sir John Llewelyn, which, by the way, I was told was a Welsh introduction, it is by far the best early of the day. But earlies should not be grown as late suppliers. It, however, does not equal Duke of Rothesay in quality, which is really superb. The tubers are large, but it tends to disease more than the above varieties if left in the soil. Respecting Up-to-Date there were, and are, men who consider it a bad flavoured Potato. I myself have discarded it owing to its poor crop and blightiness. In Lines, terrible reports are to hand of its present rotten state in the clamps (pies). As to size, Sir John Llewelyn and Royal Kidney can grow large, at least they scored over the "Star" in that respect, and a market man I am acquainted with grew the "Sir John" for stock-raising, and he is complaining because all his stuff is so large, being 4 in to 6 in in length; but I may say he cultivates his ground well.

As to the big yields mentioned by Home Farmer, 6 tons to half an acre is not large. I have bonâ fide reports of Northern Star in Lines, coming up at 14 tons and 18 tons to the acre; Evergood at 18 tons per acre; and King Edward VII. at 18½ tons per acre; and by his own showing Evergood runs up to 15 tons, which at 16s. per cwt. works out at a fair figure, and I dare hazard that were he to plant his crop again the yield would pay better than the same value, viz., £140 worth of Northern Star. As for Ninetyfold, it has a peculiar trait of coming very ugly, and especially was this so this season. It is a heavy cropper and very fair quality, and for some reason does not drop below 16s. per cwt. Personally, I shall drop it. As Home Farmer remarks, King Edward VII. is a heavy cropper and of large size, but this season made it come coarse, except on poor soil, when the tubers were like wax models. The colour should not be against it any more than Beauty of Hebron, which is still grown for market, and I hazard a guess that King Edward VII. has a little Beauty blood in it, although so much more vigorous. We cannot, however, learn its pedigree, for the raiser (a Durham gardener) is now dead. A couple of tons of it were recently sent to Spitalfields Market and it sold immediately, the buyers coming next day for more; but as they merely sent it as a feeler, no more were to be had. As to quality:—From tests I have made, both at lifting time and recently, it is very good; but not so mealy as Beauty of Hebron. Northern Star, which I tested alongside of Dobbie's Favourite, was many points behind in flavour, and to my mind it will not gain a hold like Up-to-Date. The Crofter is a very superior-flavoured Potato, being the best of all bar a pair of 1903 novelties.—GROWER.

\* \* Numerous letters are held over.

#### The Sea Buckthorn.

*Hippophaë rhamnoides* (the Sea Buckthorn) delights in a moist soil, and planted in a mass it forms an appropriate object for the waterside, whether pond, lake, or stream; in summer the leaves cast a silvery sheen over the water, while the berries in winter form orange-coloured ropes along the branches. The current year's branches are covered with minute scales, and these furnish exquisite objects for those who are fortunate enough to have a microscope.

#### A Garden at Ayr.

The garden is that which surrounds the magnificent and beautiful statue to Robert Burns at Alloway, distant two and a half miles from the "Toon o' Ayr." Electric tramcars convey thousands of visitors and excursionists to the Monument during each of the summer weeks, and those who have had the enjoyment of a journey there must have felt gratification to see the garden of flowers that surrounds the architectural memorial. I was informed by the ticket collector that further extensive additions are to be made. A hotel with tea gardens has been provided close by—between Alloway Kirk and the Auld Brig o' Doon, and the spot has become a place of traffic for many unintelligent roysterers.

Yew hedges are planted about, and give an air of cosiness and peace to the garden, and here one finds Tree Pæonies, Rhododendrons, *Thujopsis dolabrata*, *Cryptomeria elegans*, also *Gynerium* or Pampas Grass, *Aquilegias*, *Negundo aceroides*, *Arbutus* in berry, variegated Elder, *Veronicas*, *Antirrhinums*, *Roses*, *Clematises*, *Chrysanthemums*, *Violas*, and "Geraniums," all in the pink of condition. The Burns Monument was erected in 1820 by public subscription, King George IV. heading the contribution list with fifty guineas. The Monument and gardens are now under trustees, and a charge of 2d. per person is made on entry.—W.

#### Jumping Beans.

The so-called "Jumping Beans" of Mexico, California, and Brazil are neither round or triangular; they are a sort of go-between. They remind one of an unroasted Coffee bean, a Cherry-stone, a flattened Pea, or a Beech nut. Generally at first, when they are exposed to view, the onlooker's face is full of gloomy doubt; but this soon gives way to impatient curiosity and satisfaction as the yellow-grey seed-like bodies dash themselves against the sides of the box, or send the others spinning round by being dashed against them. And all the time the unseen impulse is from within, and this is what makes the plantlets look alive, and to possess definite will power. If a large portion of the rounded part be cut away, the real cause of the drumming and dancing will be seen to be a little moth, not half so formidable as its scientific name—*Carpocapsa saltitans*. The tapping of the moth's tail against the sides of the Bean supplies the dynamic. They soon travel across a heated plate, or table top, causing immense fun. They are just the thing to supplement or take the place of a parlour game during the winter evenings. By this jumping they get away from the parent trees, but whether this is for the safety of the moth or the dissemination of the seeds I am unable to say. Their movements and tappings are even more mysterious than those of the "fortune telling" fishes made of gelatine paper—another very interesting and instructive plaything. As to how the insect finds its way into the interior of the Bean, the generally accepted theory is that the moth lays its eggs inside the fruit or seed, while the structure is soft and cellular, and before the covering grows over the eggs, gradually becoming dry and hard and woody. Others suppose that they give another beautiful example of symbiotism, and others for the protection of the moths from their enemies, or for the dissemination of the seeds, as previously hinted. They live for many weeks in their peculiar seclusive home. The writer's supply came from Wiles' Bazaar, 38, Market Street, Manchester.—S. FIELDING.

#### Yuletide Flowers.

Our centre illustration this week shows what a considerable variety of exotic flowering plants there are in general culture. Cyclamens, Carnations, Bouvardias, Stephanotis, China Primulas, Ericas, Roman Hyacinths, Violets, Camellias, and many other sweet flowers, too numerous to name in this place, are in evidence. A glance at our list of subjects in the market list on a back page serves to show what choice the flower buyer has, and the lists we lately published of plants flowering in the greenhouse at Kew will further emphasise the fact that even at Yuletide there need be no scarcity of beautiful and fragrant blossoms.

#### Christening a Rose.

A new variety of Rose, raised in Michigan by a nurseryman named Breitmeyer, and which has received eulogiums wherever shown during the last few months, has been formally christened, and bears the name of La Detroit. The following paragraph from a Chicago contemporary makes interesting reading:—"The mayor . . . then introduced Katherine, the little seven-year-old daughter of Mr. and Mrs. Philip Breitmeyer, who, standing on a pedestal, formally christened the Rose by the sprinkling of champagne on a vase of specimen blooms and reciting the following: . . ." We would add that a great banquet followed, and long orations flowed.

#### New American Carnations.

The F. Dorner and Sons Company, of Lafayette, Ind., offers two highly meritorious novelties this season, namely, Lady Bountiful and The Belle. Both are white, and have been highly spoken of as commercial varieties, the former having earned especially favourable comment. Amaze, the dazzling scarlet seedling, which Jerome Suydam, of Flatbush, N.Y., will disseminate the coming season, gives good promise of being a remunerative Christmas Carnation. It is well known that a scarlet variety must do most of its work previous to January 1, as after that date the colour finds but little demand. Mr. Suydam's houses at present are fairly ablaze. The flower is of medium size, but all the other characteristics required in a Carnation to-day appear to be present, and it is growing equally well on shallow bench and solid bed. The variety is now in its fourth year.

#### Rhubarb.

In clearing off my Rhubarb bed recently, says a writer in "The Gardener," I found some of the crowns decayed; this indicates that the bed is getting worn out and requires renovating. The first thing to be done is to select a suitable piece of ground and trench it from two to three feet deep, working in a quantity of decayed manure and leaves, as when once a bed is planted it is not easy to manure, other than by surface dressing. If it is thought that the old bed will only give sufficient to supply the following season, it will be found better to purchase strong crowns of varieties like Early Albert, Hawke's Champagne, or Victoria, the first and second named to be planted not less than 2½ft apart every way, and the latter 3ft to 3½ft. When planted, give a good mulch over the crowns—in fact, old beds should have a good coating of manure in autumn, as it protects the crowns, and the rains carry the food to the roots. It will be wise not to pull any the first season, but let the plants go on to strengthen root and crown, which will greatly increase subsequent production. Always use judgment in pulling—that is, not pulling every stick, as done by many, especially among cottagers and allotment holders, as this results in the crowns being ruined. I consider that more Rhubarb should be grown, particularly by cottagers; for, looking at the matter from a profitable point, one can say that no other crop gives such good and sure returns. If the good housewife looks ahead to winter, she will not hesitate to make a quantity of preserves for her family, especially in a season like the past, when there is a scarcity of most fruit. Those who have heated houses are in a better position, as a supply can be forthcoming by Christmas, when it will be most appreciated. The space under stages is often wasted, but if strong crowns are procured and put in boxes, pots, or even stood on an ash bottom under the stage, with soil thrown over them, they will give an early supply of Rhubarb with a minimum of trouble.

Yule-tide Flowers.

## NOTES

## NOTICES

**Mistletoe at Hampton Court.**

At Hampton Court Palace Gardens large quantities of Mistletoe are growing upon the Lime trees fringing the Lime Walk in front of the Palace. Of the scores of trees forming the avenue, there is scarcely one that does not bear several fine bunches of the plant, but all are practically out of reach, some growing on the boughs as high as fifty feet from the ground.

**Beautified Railway Stations.**

The Midland Railway directorate give £2,300 per annum as awards for the best kept platform gardens on their system. This year, out of 187 prize-taking stations spread all over the line, Malvern Wells secures the premier honours, and Matlock Bath and Five Ways are adjudged equal for the second position, and Belper and Eekington West for the third place.

**Royal Horticultural Society.**

The first meeting of the committees of the Royal Horticultural Society in 1904 will be held, as usual, in the Drill Hall, Buckingham Gate, Westminster, on Tuesday, January 5. An election of new Fellows will take place at three o'clock. To prevent misunderstanding it may be mentioned that the committees of 1903 do not vacate office until the date of the annual meeting, 1904, and in like manner all Fellows' tickets of 1903 are available until the end of January, 1904. At a general meeting of the society held on Tuesday, December 15, seventy-two new Fellows were elected, making a total of 1,412 elected since the beginning of the year 1903.

**Reading and District Rose Society.**

The first meeting of this society was held in the Mayor's Parlour, Town Hall, Reading, on the 18th inst., the president (Mrs. Benyon, Englefield House, Reading) presiding, there being a large attendance of members. The report of the committee and balance-sheet of the treasurer were quite satisfactory; the latter showing a balance in hand of £11. Mrs. Benyon was re-elected president, and Mr. W. L. Walker honorary secretary and treasurer. The chairman of the committee is Mr. J. T. Strange, of Aldermaston, Reading, a well-known rosarian; and the committee, which is a strong one, includes the Revs. T. Page-Roberts, Alan Cheales, and C. S. Turner, with Messrs. R. C. Mount, Rigg, Dunlop, and Ashby, all successful growers and exhibitors of Roses. It was decided to hold the annual show in 1904 on July 13, in the Abbey Ruins, Reading, on the site of the exhibition of the southern section of the National Rose Society in 1896. It is held that this was formerly the banqueting hall of the monks of Reading Abbey, and it is quite a unique spot in which to hold such an exhibition.

**British Fruit Culture: Committee of Enquiry.**

"At last!" our readers will say when they read the following paragraph. Yes, at last a Government Committee of Inquiry into the state of British fruit culture is about to be made, and no newspaper in these islands has more consistently and persistently advocated the need for energy in relation to our national fruit supply than has the *Journal of Horticulture*. The President of the Board of Agriculture and Fisheries has appointed a departmental committee to inquire into and report upon the present position of fruit culture in Great Britain, and to consider whether any further measures might with advantage be taken for its promotion and encouragement. The committee is constituted as follows:—

Mr. A. G. Boscawen, M.P. (chairman);  
Mr. C. W. Radcliffe Cooke;  
Mr. J. M. Hodge;  
Colonel Charles W. Long, M.P.;  
Mr. George Munro;  
Mr. P. Spencer Pickering, M.A., F.R.S.;  
Dr. W. Somerville, an assistant-secretary of the Board of Agriculture and Fisheries;  
Mr. Edwin Vinson; and  
The Rev. W. Wilks, M.A., secretary of the Royal Horticultural Society.

Mr. Ernest Garnsey, of the Board of Agriculture and Fisheries, will act as secretary to the committee.

**The Potato Boom.**

Messrs. E. W. King and Co., of Coggeshall, have just paid £300 for 2lb of the new Potato, Eldorado, which is causing a sensation all over England.

**"Corner" Formed in Pears.**

The failure of the Pear crop this year in nearly every European country has given America an opportunity of forming a "corner" in this kind of fruit, according to certain daily papers. It is stated that more than 1,000,000 boxes of Pears have been kept in store in the United States.

**The Horticultural Club.**

The next house dinner of the club will be held on Tuesday, January 5, at 6 p.m., at the Hotel Windsor. Mr. George Gordon, V.M.H., has kindly promised to read a paper entitled "The Experimental Garden of the Future." Members are reminded that subscriptions for 1904 become due on the 1st January next, and should be paid to the honorary treasurer, Mr. Harry J. Veitch, 34, Redcliffe Gardens, South Kensington, S.W., or to Mr. E. T. Cook, honorary secretary.

**Obituary: Mr. J. H. Fitt.**

It is with much regret that we have to record the decease, after a long and painful illness, of Mr. J. H. Fitt, at Welwyn, Herts, at the age of 73, he having been born at the same place on November 1, 1830. For no less than 54 years he had charge of the Frythe Gardens at Welwyn, after commencing his career as a gardener at Stagenoe Park, whence he went to Bayford Bury, Hertford, to the famous gardens of Mr. Baker, subsequently serving under Messrs. Paul, of Cheshunt, up to the time of his long engagement at the Frythe. For some years, until his illness incapacitated him, he formed one of the R.H.S. Floral Committee, where his kindly face will be much missed. Combined with a thorough knowledge of horticulture in all its branches was a special acquaintance with our native Ferns, of which he had a large and choice collection; and in this particular cult he will be equally missed by a host of sympathetic friends.—C. T. D.

**General View of Gardening Societies.**

The *Burgess Hill* (Sussex) Horticultural Mutual Improvement and Chrysanthemum Society enjoyed a festive meeting on Tuesday, December 15, at Burgess Hill Inn, where an excellent supper was served to a company of between forty and fifty, Mr. G. A. Hammond presiding.—The annual dinner under the auspices of the *Nottingham and Notts* Chrysanthemum Society was held on the 17th inst. at the Rose of England Hotel, Mansfield Road, Alderman C. Bennett, president of the society, taking the chair. The Mayor of Nottingham, in replying to a toast, said he was an enthusiastic gardener, and he was pleased to note the immense progress that had been made in the cultivation of the Chrysanthemum in Nottingham. He had been associated with the majority of the local horticultural societies, and was a member of the committee of the great horticultural show held in the Park some thirty years ago. Also he had been connected with the old St. Ann's Society, and was one of the founders of the present Nottingham Horticultural Society. Nottingham held a pre-eminent position in regard to gardening and the culture of flowers and fruit, and it was his sincere hope that the city would always hold that position. He hoped the Society would have a long and successful career.—The third annual dinner held under the auspices of the *Kingswood* (near Bath) and *St. George's* Horticultural and Fanciers' Association, took place on December 14, evening, at Kingswood Hotel, when there was an attendance of about seventy. Mr. H. Furber, president of the Society, occupied the chair. The Society has had a successful year, and has a balance in hand of £18. Larger prizes are being offered. The show is one of the best in that district. The president urged caution, however, in the dispensing of funds, and desired that the tradespeople would take a deeper interest in the Society. Its influence brought much good.—A meeting of the *Mortimer Society* (near Rea) was held at the house of the secretary on the 3rd inst. The treasurer (Mr. W. A. Wallis) presented a balance-sheet for the past year, showing a surplus on the year's show of £12 3s. which, added to the balance from last year (£13 14s.) gave a total to carry forward of £25 17s. It has been decided to hold the next show on Thursday, July 21, at the same place as before.—The committee of the *Bolton* Horticultural and Chrysanthemum Society, which has a membership of about eight hundred, held their annual dinner last evening at the Commercial Hotel, the proceedings being graced by

the presence of His Worship the Mayor (Councillor Jno. Heywood M.A.) In an approximate financial statement, Mr. Smith said that the receipts for the year amounted to £292 16s. 9d., and the expenditure to £274 10s. 7d., leaving a credit balance of £18 6s. 2d. There was an account of £10 to be considered by the committee. On the first day of the show £21 19s. 9d. was taken at the doors, and £80 10s. 6d. on the second day, the total being a decrease of over £6 on last year. In subscriptions, £160 was raised, and £145 13s. 6d. was given in prize money.

## Fruit Notes.

### Fruit at Christmas.

The festive season of 1903 finds us all too badly provided with supplies of home-grown hardy fruit. Many of us must look in vain for the Blenheims and Cox's, or the Newton Wonders, for the kitchen. Sad also is it to note the absence of our old friend Glou Morceau and other late varieties of Pears that have been wont to lie on our stone shelves at this festival time.

That gardeners have commiserated with each other upon the dearth of fruit generally is well known, and it may seem scarcely necessary to enlarge upon an anything but cheerful subject at what should be the most joyful of occasions. Living in a fruit-growing district, where as a rule Apples may be purchased at a very low rate, it is certainly not inspiring to find they cannot be bought at less than fourpence per pound. What the retail price of good English Apples must be in large towns I have no means of knowing; doubtless the foreign supplies prevail, but in small centres sales are too slow for vendors to deal with these in bulk. Pears are conspicuously absent from the windows of local shops, yet the price of those from abroad does not appear prohibitive in the wholesale markets if one scans the lists of prices in various publications.

Turning from the scarceness of hardy fruit, it must be matter for congratulation to the consumer to find really good home-grown Grapes at the low figure of but one shilling per pound. Really capital black Grapes can be procured for this small sum; whether the growers are to be congratulated on their returns is a question open to some doubt. Heavy crops may, and probably do, afford a small margin of profit at such a price; compare this, however, with Apples at fourpence, and it is not difficult to decide who has the advantage in the way of profit—comparing the grower of Grapes and the grower of Apples; but this year is exceptional, and happy indeed is he who holds a few bushels of really first-rate dessert or culinary Apples. And this is where the foreigner steps into the breach, sending us heavy consignments and reaping a rich harvest of British money.

There is some compensation to the poorer members of the community to find dried fruits—which form so large an addition to our Christmas fare—are cheap and good. From time immemorial it has been our custom to import these, not alone, it is true, for this season, but for various dietary purposes throughout the whole year, but more especially in winter, when our own fruit supplies are usually at a low ebb. Many of these dried fruits we shall doubtless continue to buy from foreign sources, but some of them we ought to be able to dry and preserve ourselves. Why can we not so treat our Plums in years of glut that ample stores may be at hand for disposal at this period?

Of course we all know the answer to such a question. But surely we ought to be able to dry, store, and vend at an equally low rate with our Continental rivals, who not only do this, but send the fruit hundreds of miles by sea and land to market. No! we go on, year after year; the same old arguments are trotted out, for and against. In the meanwhile, in seasons of plenty or over-supply, tons of fruit rot upon the ground which at this and other times would form a most wholesome article of food.

It is to be feared I am in some measure digressing, but a little latitude may well be allowed at Christmastide; and while upon the subject of preserving fruit, I should like to refer to the short article by Miss Bradley in the last R.H.S. Journal on bottling various fruits. We are here shown that for what cannot fairly be called a heavy initial outlay we may provide ourselves in years of surplus, very cheaply, with fruit for times of shortage. It has been conclusively proved that, when successfully bottled, fruit will keep fresh and good for many months. Putting aside the market aspect, there is here given us much to reflect upon from the point of view connected with private use. Why should the Briton continue to pay a heavy price for what he can grow and preserve for his own use at very little more expense than the cost of one of the machines depicted in the article to which I have referred?

Granted that in some few large establishments there is a certain amount of bottled fruit at hand for almost any occasion, yet the great majority of people, if they wished to indulge themselves with a Gooseberry tart on Christmas Day, would cer-

tainly need to buy from a foreign source, even though the fruit came through their family grocer. Apricots, Peaches, Tomatoes, Currants—in fact, all kinds of fruit—may be so treated at home as to be available in all times of scarcity; and still we go on buying from abroad when it is so unnecessary and the money is needed in our own land.—SANTA CLAUS.

(To be continued.)

### Productive Tomatoes.

A variety of Tomato that has established a good record for both market and private use is Lister's Prolific. No variety that I have yet grown or seen surpasses this for indoor culture, and for outdoor use Holmes' Supreme makes an excellent companion. In a small span-roofed house which accommodated thirty plants in nine-inch pots, and these trained up the roof wires, something like 400lb of fruit have been gathered, all of good quality, shape, and colour (see illustration). The first picking weighed 60lb, and in the same week a quarter of a hundredweight more were added. The pots stood on a corrugated iron staging covered with einders, and these being kept moist from the growth of other plants in summer beneath the Tomatoes, afforded an auxiliary feeding ground for the Tomato roots.

It is doubtful whether the same quantity of fruit would have resulted from planting in the border at the regulation distances apart and supported with stakes or string; and while a good crop of Tomatoes has been provided, there has been a use for the stages permitted for the growth of other pot plants without hindrance all the season through. This little structure measures but 20ft long by 12ft wide, running north and south, and for Tomato culture affords the requisite conditions for setting and ripening to a remarkable degree. They were sown in January and photographed at the end of July, and by the end of September cleared out again for plant accommodation during the winter months.—W. STRUGNELL.

Tomato, Lister's Prolific.

## Societies.

### National Potato.

SUMMARY.—A society has been formed. Earl Rosebery will be invited to become president. Mr. A. D. Hall, of the Rothamstead Experiment Station, is chairman of the executive committee, and Mr. W. P. Wright is honorary secretary. There will be trial plots in a large number of counties. The membership subscription is 2s. 6d. per annum.

The meeting which had been called at the Hotel Windsor, Westminster, London, on Wednesday last, was presided over by Mr. A. D. Hall, Director of Rothamstead, and over forty persons from the north, south, east and west attended.

The speaking was left to a few—not that there were not plenty of willing speakers, but the formation of the society was a foregone conclusion, requiring no argument, and the objects were so embracively included in Mr. Walter Wright's resolution that further discussion at the moment was superfluous. The Chairman having spoken at some length, the proposer of the resolution took the floor, and what with quotations from a huge bundle of letters which he had received from representative men in all parts of the kingdom, he occupied the attention of the meeting for over half an hour.

We can only allude to a few leading points. It was stated that we imported £2,000,000 of Potatoes during the past year that might be grown at home. Then there are other and newer diseases than the familiar and dreaded *Phytophthora* blight, which demand special attention. There is also the question of better classification of varieties for exhibition purposes, and a central body for appeal in cases of doubt or dispute. Then, again, much time and money would be saved to market men and other growers if new varieties were authoritatively tested in many different soils and localities. These things the society proposes to keep in view and to work upon.

The resolution was to the following effect:—That this meeting is of opinion, having in view the importance of the Potato as a cropping plant yielding food product, and the diseases to which it is subject, also the need for classification and trial of varieties, that it is desirable to form a society, and agrees to the formation of the same.

Mr. Wright also included in the resolution the names of the officers who were thereafter elected as follows:—**EXECUTIVE COMMITTEE**: Messrs. A. D. Hall (chairman), Geo. Gordon (vice-chairman), E. Beckett, Lewis Castle, A. Dean, H. Dunstan, Dr. Masters, Prof. Percival, and — Foster. The superintendents of trial stations who collectively form the **TRIALS COMMITTEE** are: Messrs. Berry (Northumberland), R. Cock (Staffs.), A. Dean (Surrey), H. Dunkin (Warwick), H. Ettle (Somerset), Goring (Sussex), Howman (Glos.), S. Heaton (Oxford), D. Houston (Dublin), Illot (Cornwall), Mann (Bucks), Neald (Cheshire), Redding (Yorks), J. B. Riding (Essex), T. Sharp (Wilts), Smith (Midland Agricultural Institute), J. Udale (Droitwich), Walkley (Chelmsford), J. Weathers (Middlesex), J. Wright (Surrey); also Mr. Newsom and the Cambridge Hort. C.C. Instructor.

### Newport (Mon.) Gardeners'.

The usual meeting of the above association was held on Wednesday evening last, when Mr. T. H. Jarvis read a paper on "The Duties of a Qualified Gardener." In the first part of his paper, which was of a very humorous character, Mr. Jarvis gave what he considered to be the necessary duties of a thoroughly qualified gardener, these duties extending over a very wide range. He then proceeded to give what gardeners, especially in single-handed places, were often expected to do, causing much amusement to those present. A spirited discussion followed, in which Messrs. Harris, Jones, Powell, Woodward, Duff, Pegler, Wiggins, Daniels, Basham, Dodds, and Preece took part. Mr. Jarvis was accorded a very hearty vote of thanks for his very entertaining paper. Mr. J. Duff was awarded the society's certificate of merit for six *Alba plena* Primulas, which were splendidly grown and flowered. Mr. Duff presided over a good attendance.

### Hull: Essay on Hippeastrums.

At a meeting of the Hull and District Horticultural Association on Tuesday, December 15, with Mr. Tattersall in the chair, an essay on *Amaryllis* (*Hippeastrums*) was read by Mr. J. Donoghue, of Bardon Hill, Headingley, Leeds. The essayist dwelt on the popularity and possibilities of this gorgeous bulbous plant, traced its history, and explained that although gardeners clung with grim tenacity to the more euphonious name of *Amaryllis*, it was nevertheless botanically inaccurate. Authoritative extracts were read to substantiate this.

The varieties existing about the beginning of last century were recapitulated, and from thence was shown the pedigree or origin of the many different forms now grown amongst us. Coming into a more familiar sphere, Mr. Donoghue ably detailed the culture from the seedling or offset to the flowering of the

bulb in the third year. Seedlings, he contended, were more robust (chiefly owing to the infusion of fresh blood) than were offsets. Thin sowing, gentle heat, even atmosphere, constant plunging, prudent manipulation of syringe, and in the early stages entire absence of the water pot, comprise briefly the advice given for the first year's treatment.

The essayist also commended gradual drying off and repotting just before the commencement of root action. If flowers developed during the second year, it was at the expense of the vigour and constitution of the bulb.

The discussion was joined in by Messrs. Tattersall, Pickers, Wilson, Posthill, Lawton, and Horsfield, each of whom expended words of praise on both the essayist and the essay. —W. R.

### National Fruit Growers' Federation.

The position of the Federation continues to improve steadily. The increase of its membership, though not so rapid as might be wished, is constantly going on, especially in Kent, which county is now its stronghold. The Council have been lately engaged in work of a more useful than ornamental or sensational character. For instance, the new disease which has appeared amongst Potatoes has been carefully inquired into, and efforts are being made to induce the Board of Agriculture to take steps to prevent it from spreading. A most instructive paper was read by Mr. W. Horne, of Cliffe, near Rochester, on the Codlin moth, and an interesting discussion took place at a subsequent meeting upon it. Such questions as the danger to public health from the use of vegetables grown on sewage farms, and the increase of assessment to local rates and income tax on the ground of farm land being planted with fruit, are now also occupying the careful attention of the Council.

\*\* Reports of a number of societies' meetings are unavoidably held over.

The weather has again been dull and very dark.

### Young Gardeners' Domain.

#### An Old Boy's Greeting.

From a literary point of view it is bad taste to address readers personally. From my own point of view I would, as we all step together over the threshold into the unknown of another year, voice a cheery word through the pages of "our Journal" to each and all in Bothydom. Even to us—old heads—comes a freshness and hopefulness as we reach another milestone on life's journey, which, possibly we are not justified in feeling when looking back at the many which stretch away behind—away into the dim perspective of our own dear old bothy days. To you, young brothers of the craft, who have not the prerogative of a past, it is all that it is, to us and more also, being infinitely more important, for, as George Eliot says, it makes a considerable difference whether one has half a century before them or behind them. Hence would I at this opportune time give you an encouraging word to fight on manfully, perseveringly, yet consistently, to the end of winning good positions in the gardening world, and that these earlier new years of life may be for you, when looking back at some future time, what Thackeray called *The Happy, The Bright, The Unforgotten*.

Much has changed in the gardening world generally, and in the bothy particularly, since I bade farewell to the latter one autumn morning many years ago; but much has not changed, nor will change while human nature exists. There is the same diversity of character in Bothydom as of yore; ranging from the happy-go-lucky boy whose high, infectious spirits bespeak a gardener's life as the jolliest one imaginable, down to the dull, listless lad who lolls away his leisure as a thing to be rid of instead of seized upon as a precious possession. The one can neither descend nor the other rise to the stern realities of life. Such extremes exist, but are, happily, exceptional, and the bulk of our raw material in Bothydom is sound, healthy, and promising. Alas! That there should ever be that great gulf, or any gulf, we sometimes see 'twixt promise and performance in the manufactured article; hence I regard bothy life as a critical period, for "no plainer truth appears, our most important are our earliest years." It was not my intention, however, to generalise, or to moralise; rather would I at this season, and seasonable time, briefly supplement that advice I have previously been privileged to give in these pages, by expressing a sympathetic thought for the welfare of my young brothers.

Taking it for granted that plan drawing, high-class reading, and what not, are, during the long nights of winter being carried out and on bravely in the earnest endeavour to make this self-tuition a sound and solid factor in future success, I would ask you are you doing all this methodically and upon a clear and well-defined plan? If not, may I impress the desirability of this matter receiving the consideration it deserves? *Pereunt et imputantur*, says an old sun-dial, or in our tongue, "They perish and are forgotten." One of the illusions of bothy life is that time in it appears so long; whereas, in reality, it is so short. In spite of the many advantages present day pupils possess, and the helps they have, the peculiarity of a gardener's education still remains, leaving him, practically, a self-taught man. The working duty exacted from a youth by his master may be scrupulously performed, whilst his duty to himself is wholly neglected, or carried on in such a desultory manner as to be not only valueless but actually antagonistic to the mechanical training which goes hand in hand with the daily routine.

Do you, young friend, realise the power that is within you, and the possibilities within your reach? If so, you are probably mapping out your course, and it is a good time, this, for making plans, if not already made, apart from those plans of flower beds or buildings you may be busy at—plans which if truly drawn on a conscientious scale, will prove to be a reliable chart of life. It is, of course, the season at which crops of plans are sown as thickly as mustard and cress, and the bulk of them are as short lived, hence they should be simple, sound and few. "Singleness of purpose often accomplishes more than a plurality of talent." Whilst impressing the importance of these matters, and without going into details which you are well able to supply—whilst impressing the importance of your seizing the flying moments in Bothydom to equip yourselves for the battle of a gardener's life—I would that you should try to fit as well as fill the position; so elevate yourselves as to be, or become, gentlemen in the true sense of the word, and for which the refining influence of gardening should do much, and your higher aspirations, if quickened towards an ideal life, the remainder. The bothy, unfortunately, is not congenial to the cultivation of correct conversation or address, nor is it a court of etiquette and polite manners, yet this educational refinement is, possibly, more essential to gardeners in after life than to any other class of men in the world of work. "Virtue, itself, offends when coupled with forbidding manners." The old school of gardeners is dying out, and we can ill afford to lose the courtly, polished, gentlemanly man who, as well as being a sound, practical gardener, was an ornament to his profession. This is, possibly, more or less clear to you, for amongst even young gardeners the bank balance is not always regarded as the barometer of human worth.

The last remark brings up a point not previously emphasised, I think, in any of our *Journal* chats, and I hope I do not stultify myself in pointing to the need of economising not only your time, but your money. The invaluable facilities for saving afforded by the Post Office Savings Bank need no encomiums from me, but I regret that so few of our young gardeners avail themselves of the splendid opportunity it affords for accumulating any spare shillings. A grand time this for starting a little account with His Majesty. In fact, the birth of a new year and the death of an irredeemable old one is admirably adapted for many things, and capable of many things; which, of course, is but a truism, but for you, if you will it, it should be a happy new year. Aye! A Happy New Year; no mere stereotyped phrase, passing compliment, or empty sound, but fraught with all the deep significance and inherent potentiality it is capable of bearing. Such may it be to each, and to all of you, in Bothydom.

## THE BEE-KEEPER.

### The Stewarton Hive.

This hive derives its name from the town of Stewarton in the north of Ayrshire. Its origin is rather obscure, but it is supposed to have been invented about the year 1819 by Robert Kerr, a cabinet maker of that town, and familiarly known as "Bee Robin." Its merits have ready championship amongst Scotsmen, particularly in the South of Scotland, where there have always been some remarkably clever bee-keepers. The hive, of which there have been many modifications, is octagonal in shape, which is considered the nearest approach to the circular and natural form in which the bees cluster, and is made up of from one to three body boxes, or brood chambers, 14in wide inside measurement, and either 7in or 9in deep, having eight bars, the six centre ones being 1½in wide for brood production, and the two outside ones 1½in wide, in which the honey is stored. The bars are fastened in the hive by half-inch screws, which may be removed if it is desired to render the bars moveable. Foundation is, of course, fitted to the centre of each bar as with the ordinary bar-frame, but when the comb is completed it is thicker.

The boxes, which are very accurately constructed, fit exactly upon each other, and are fitted with a window and a moveable shutter at the back and front, so that it can be easily ascertained how the work of comb building, &c., is progressing. Generally three entrances, 3½in wide and ½in deep, are fitted in the bottom of the body boxes, which have slides for contracting or closing them altogether. In a prosperous hive, when the weather is warm, these entrances are not considered too much for ventilation and for the traffic of the bees. In addition to the numerous body boxes there are supers of corresponding width, but only 4in deep, furnished with seven bars 1½in broad.

One of the disadvantages of this hive is that its cost is considerably increased by an extra covering, which is absolutely necessary for it. This outer casing should be about 20in square, plinthed all around so that each lift fits on the lower one, and they should be capable of tiering in order to expand and contract in an exactly similar manner to the "W.B.C." method. The floor board is made to fit the outer casing, and is extended in the three positions necessary for entrances, which are sloped so that the rain will run off. The roof also is octagonal in shape, sloping and overhanging all round. The combs in the Stewarton hive are made moveable by dispensing with the screws, but are only interchangeable in similar positions in the different boxes. The general method of feeding is by a trough fitted in the floor board of the hive.

Before packing for the winter all the wooden slides in the tops of the supers have to be withdrawn, and the whole of the top is then covered with a piece of carpet, ticking, or other warm material, except woollen fabrics, with an aperture cut in near the centre, and over this three or four thicknesses of warm quilting are placed. Queen excluder is not used with this hive, the bees being admitted to the supers by withdrawing the outside slides. The extra thickness of the combs, the shallowness of the supers, and the depths of the cells of the drawn out bars, all have a tendency to deter the queen from using the supers as brood boxes, but very much in this respect depends upon the neighbourhood and the season. The additional empty supers are placed on the top of those which are partly filled, but more breeding room can be given below, which is an advantage in the management of this hive, as the heated air ascending from the bees working below obviates any possibility of the brood chilling.—E. E., Sandbach.

### "The Life of the Flower."

One of the pleasantest features of the periodical literature of our time is the number of attempts to bring the mysteries of science and the beauties of the life around us home to the minds of those busy people who read newspapers and magazines, but who have neither the time nor the inclination to study formal treatises upon subjects not directly connected with their own work. More particularly has this been the case with Natural History, in which an interest has been excited which would have seemed incredible to White of Selborne. If Richard Jefferies were alive to-day his exquisite work, instead of a cold reception by an unappreciative world, would be eagerly sought by editors, and devoured by an enthusiastic public. Undoubtedly the change is largely due to an enlightenment which has been brought about by the Press, which has not only summarised in various attractive forms the conclusions reached by patient investigators, but has spared neither money nor pains to procure original work from writers, the fascination of whose style charms even the most careless into an interest in birds and beasts and flowers, which they had never suspected they possessed.

### Fruit Forcing.

**VINES: EARLIEST FORCED IN POTS.**—The canes that were started in November will now have the root action excited by the development of the foliage. Great care is necessary at this stage to avoid chills, such as those resulting from cold currents of air and watering with cold water or liquid manure. The temperature about the pots should be kept steady at 70deg to 75deg, pressing down the fermenting materials, adding fresh, but sweetened, as required, it being good practice to keep a heap of leaves and stable litter in reserve, from which the supply may be drawn as needed. Disbud and tie down before the shoots touch the glass, not being in too great a hurry in stopping. When two leaves are made beyond the bunch pinch off at that point, the laterals being stopped to one leaf as made. Superfluous bunches should be removed as soon as choice can be made of the best, leaving those for the crop that promise to be the best shaped and most compact. It is better to have the Vines under rather than over-cropped. The night temperature should be maintained at 60deg to 65deg, and 70deg to 75deg by day, with an advance of 5deg, 10deg, or 15deg from sun heat, according to circumstances. When the flowers open keep the temperature 70deg to 75deg regularly, and maintain a rather dry but not arid atmosphere, and when the fruit is set return to the temperature previously named. Supply liquid manure copiously when the fruit commences swelling; yet it must only be given when the soil is moderately dry, as excessive supplies cause soddenness and lead to shanking and bad finish. Maintain a moist, genial atmosphere by damping the paths and walls two or three times a day, and occasionally with liquid manure, not too strong, or the ammonia volatilised may prove injurious instead of beneficial to the Vines.

**PLANTED-OUT VINES STARTED IN NOVEMBER** require similar treatment to Vines in pots, but the bearing shoots may be stopped three or four joints beyond the fruit, and then extend the growth so as to secure as much well-developed foliage all over the house as can have full exposure to light, taking care to avoid overcrowding.

**HOUSES FROM WHICH THE GRAPES HAVE BEEN CUT.**—Pruning should be completed without delay, cutting to a round bud as near the stem as consistent with promise of a crop. Shorten or cut away elongated spurs where there are others nearer the stem to supply fruit, or train up young canes to displace them. Remove loose bark carefully, not scraping into the quick or live bark, and thoroughly cleanse the house, washing the Vines with a solution of carbolic or petroleum soap (4oz to a gallon of water), or some other approved insecticide, at winter-dressing strength, employing a brush and reaching into every angle, hole, and crevice. Avoid strong soapy solutions, as they ultimately dry the bark and cause the Vines to break weakly. Remove the loose surface soil, especially near the collar of the Vines, and supply fresh loam, with about one-third of decayed stable or farmyard manure. Loam seems to favour root action, and it holds the other fertilising substances, so that the roots find abundance of nourishment when proper supplies of water are given during active growth. The house should be kept cool, but frost is best excluded. If used for plants the temperature ought not to exceed 40deg to 45deg by artificial means, and those plants only that require safety from frost should be placed in vineries when the Vines are at rest. If the house has a mean temperature of 50deg the buds will be started, and that is prejudicial to the after growth, as alternating excitements and retardments more or less affect the constitutional energy of the Vines.

**LATE HOUSES.**—Muscat of Alexandria and Canon Hall Muscat are extremely difficult to keep on the Vines after Christmas, which may be due to the fluctuations of temperature and variability of the atmospheric moisture, the principal difficulties being to keep the temperature even and prevent the deposition of moisture on the berries. Some growers prefer to let the Grapes remain on the Vines. To keep the temperature equable and exclude fogs and damps, cover the roof lights with straw mats or similar material, keeping the house freely ventilated in mild weather, and close when cold, with little more heat than is necessary to exclude frost. Grapes so kept weigh heavier than those that hang some time in a drier and warmer atmosphere, and Muscat so preserved command high prices, but the Grapes do not always keep well.

**FOR GENERAL PURPOSES** Grapes are best kept after the new year in a Grape room, cool, dry, and as equable in tem-

perature as possible, and the more wood they are cut with the better they will keep. Place a lump of charcoal in each bottle before the end of the shoot is inserted in the rain water, provided the temperature is kept equable, or as near as may be 40deg to 45deg. By cutting and bottling the Grapes the Vines are set free for pruning and cleansing the house. Alicante, Gros Colman, and Lady Downe's succeed well under the close pruning system, spurring to one or two buds, the bearing shoots being stout and short-jointed; but Gros Guillaume and Mrs. Pince do best on the long pruning system, cutting the shoots to a plump bud on well-ripened wood, as the small basal buds are seldom reliable, often pushing fruitless shoots.

Muscat of Alexandria and Canon Hall Muscat also succeed best on the extension system, but sturdy, short-jointed, well-ripened, and not overcropped shoots of these varieties generally show enough fruit when pruned to two buds, though when the buds are small and the growths weak or long-jointed it is better to shorten to the shoots to the first plump bud from the base, always taking care to rely on those on well-ripened wood. Where the Grapes cannot be cut for some time the mean temperature should be maintained at 45deg, 5deg less as a minimum and 5deg more as a maximum, admitting air constantly in mild weather, but keeping close when foggy and cold, then with a gentle warmth in the pipes to ensure the air moving. This is the grand secret, as stagnation causes the exact condition under which micro-organisms germinate and thrive, they speedily reducing Grapes to a decaying mass and common level.—G. A., St. Albans.

### Kitchen Garden.

**TRENCHING GROUND.**—Vacant portions of the kitchen garden should receive good winter cultivation by breaking up the soil to a good depth, and, in doing so, not only including the top spit, but the spit below and the subsoil as well. Moving soil to the depth mentioned is always beneficial, but the manner of doing it is of rather more importance than may at first sight appear. It is generally found that the top spit is of a more fertile character than the lower; therefore, when this is the case, the relative positions of the various spits should not be changed. This is easily done by the process of bastard trenching carried out as follows:—Take out a trench 2ft wide and two spits deep, half way across one end of the plot to be trenched, and wheel to the same end of the other half. Next cut another trench the same width, and take out the first spit, placing it with the other soil removed. The bottom spit of the first trench should then be broken up and left where it is, and the second spit of the second trench should be placed on the top, finishing with the first spit of the next trench. Continue in this manner, adding manure between the bottom and second spit. By this method fertile soil remains on the surface while the material below is broken up and begins to improve in quality, until in time the whole depth will be of uniform fertility.

**PREPARING HOTBED MATERIAL.**—Hotbeds will shortly be required for various purposes; hence the preparation of material for forming them ought to be commenced. Dry or moderately dry Beech and Oak leaves are admirably suited for mixing with fresh horse manure. Until a quantity both of manure and leaves can be brought together they should not be encouraged to ferment, but be spread out thinly; then, when enough has been secured, throw into a heap to ferment, turning over several times to drive out the fierce heat and strong gases evolved. After this it will be ready to form into beds, preferably within brick frames, as this will to a great extent conserve the heat. Open beds, however, built up with a frame on the top have the important advantage that they can have the heat renewed from time to time by linings on the outside of fresh material.

**POTATOES.**—If kept thoroughly dry and cool in the store room or shed, and protected during frosty periods, little harm will come to the tubers. Damage to the tubers spreads very rapidly when damp conditions prevail about them, or disease-infected tubers are allowed to remain among sound specimens. Seeing that there is the possibility of this occurring if the Potatoes were in the least affected when stored, it is desirable to make an examination of them at this time, and separate sound from unsound tubers. While doing this the tubers most suitable for seed may be selected, placing them in shallow boxes and store in a light position. Potatoes for cooking must be kept from the light. Good, clean, dry straw or bags may be used as a covering, increasing the depth in the event of severe frost.

**LIFTING ROOT CROPS FOR USE.**—Although many roots, including Parsnips, Jerusalem Artichokes, Salsafy, and Horseradish, are left in the ground as a rule until wanted, and there keep in good condition, it is desirable to lift a portion of each crop and lay in in soil in a shed, so as to be readily at hand during severe weather.

**PLANTING HORSERADISH.**—The opportunity may be taken, if a plot of deeply dug ground is prepared, to replant a

bed of Horseradish. Roots nine inches to a foot in length and about the thickness of the little finger, each with a crown, may be selected. Rub off the side rootlets to within an inch of base. Plant a foot apart in rows two feet asunder, burying the crowns just below the surface. If not convenient to plant now, suitable roots may be selected and laid in moist soil or sand; also prepare the ground for their reception, deep digging being essential, working manure into the bottom spit of soil only. —EAST KENT.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense. In naming plants we only undertake to name species, or well-marked varieties, and only six on any one occasion. Florists' flowers we do not name.

VARIOUS (Alph).—Your queries will receive attention in our next issue.

DOUBLE BEGONIAS (E. J.).—We cannot tell whether they are whites or not. Wait until they flower.

CERTIFICATES FOR PLANTS (T. S.).—If you carefully explain your requirements to a local job-printing firm you ought to be able to get what you want.

NATIONAL FRUIT GROWERS' FEDERATION.—We are informed by Mr. A. T. Matthews, secretary to the above, that his address is now 6, Fairlawn Grove, Chiswick.

MUSHROOM BEDS ON THE BORDERS OF TOMATO HOUSES (T. T., Markets).—Beds made up in October, after the Tomato plants have been cleared out, will commence bearing in from a month to six weeks after spawning and earthing, and they will continue to bear for about a similar period. The beds should be made on the border of the house, not taking out dry soil for the making of the Mushroom beds. After the beds are spawned and earthed, a light covering of soft straw is advisable in order to maintain uniformity of heat and moisture in the beds, but it is not desirable to employ a thick covering in the case of beds where a suitable temperature can be maintained. This for Mushrooms is 55deg to 60deg. The time for inserting the spawn is when the heat of the bed is decreasing but has not fallen below 80deg, inserting the spawn an inch below the surface. The Mushrooms are packed in punnets, three different sizes being employed, namely, for "buttons," 5in in diameter and 3½in deep, and known as "deep pounds"; for "cups," 6½in in diameter and 2in deep, known as "flat pounds"; and for "broilers," 5½in across and 1in deep, sold as halves. "Buttons" are Mushrooms that have the cap of the pileus united to the stalk, and the laminae or gills not visible. "Cups" are a step advanced in development, the membranous covering with the stem being broken, but not showing more than a ring of the laminae, half an inch in diameter. "Broilers" are Mushrooms fully expanded, of the form of an inverted tea saucer, and showing the gills clearly.

The Mushrooms, carefully gathered and the stems divested of any loose particles of soil or manure, are weighed into pounds and placed in the punnets with the best samples on top and forming a regular surface, neatly papered and secured with wrapper. The punnets are packed in light yet sufficiently strong boxes, and of convenient size to hold the number of punnets. A box 3ft 2in long, 1ft 11in wide, and 1ft 4in deep, a 1in batten being nailed across the inside of each end 8in from the bottom for supporting a floor or shelf after the bottom of the box has been occupied with punnets, accommodates fifty-six to sixty punnets; and a little clean hay being used to make all firm, a few strips of deal tacked across for protection, the produce may be sent any reasonable distance without fear of injury.

In gathering the Mushrooms they are twisted off, leaving no part of the stem in the bed, and they are packed with their stems entire, just as gathered from the beds, minus the soil that is drawn out with the roots, and which is shaken off as the pulling proceeds, the stumps (if any) of the cluster that snap off close to the surface being scooped out with a knife and, of course, discarded. As to watering, it is important that the soil never be permitted to become dry, and water must be given as often as is necessary in sufficient quantity to prevent this.

In the case of covered beds the water must be sprinkled on the straw—not under it—in sufficient quantity to percolate

through it and gradually moisten the soil; and immediately after watering the beds they should be covered with mats to prevent the moisture evaporating. In case of the Tomato houses not being heated there will be little difference as compared with outdoor beds. These should be about 2½ft wide at the base, about 6in wide at the top, and 2½ft wide. The covering for beds made up in October will need to be thickened in cold weather, so as to exclude frost and maintain at the surface of the bed a temperature of about 50deg. If the weather be mild and the bed comparatively new, a covering of bunches of litter will suffice, while during severe and prolonged frost 2ft or more in depth of straw, protected with mats, will be necessary.

To answer your questions fully would require several numbers of the *Journal of Horticulture*; therefore we advise you to procure "Mushrooms for the Million," or the series of handbooks on vegetables for profit: No. 1, Green Crops; No. 2, Root Crops; No. 3, Asparagus, Peas, Beans, &c.; and No. 4, Mushrooms, Cucumbers, &c.; price 1s. each; published at 148 and 149, Aldersgate Street, London.

NAMES OF PLANTS.—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (Surrey).—1, *Nephrodium molle*; 2, *Lomaria nuda*; 3, *Cyrtomium Fortunei*; 4, *Adiantum cuneatum* var.; 5, *Adiantum cuneatum*. (J. T.).—Strawberry Tree (*Arbutus Unedo*). (A. F.).—1, *Maranta zebrina*; 2, *Tradescantia procumbens*.

## Trade Notes.

Messrs. Hugh Low and Co., Royal Nurseries, Enfield, write: "We have to notify you that Mr. Cornelius Barnard, who has been with us for a great many years and recently employed as wholesale traveller, is leaving our service at Christmas. We are anxious that it be understood that it is *Cornelius* who leaves our service, and not Mr. H. A. Barnard, who is so well known throughout the country."

W. J. Godfrey, Exmouth Nurseries, Exmouth, sends a full-size photographic reproduction of the new Japanese Chrysanthemum, Lady Cranston. Messrs. Wells and Co., Limited, Earlswood, Redhill, also send their usual sheet of Chrysanthemum novelties, illustrated by half-tone reproductions.

## Trade Catalogues Received.

R. H. Bath, Ltd., The Floral Farms, Wisbech.—*Seeds, Paeonies, Carnations, Roses.*

Frank Dicks and Co., 68, Deansgate, Manchester.—*Seeds, Gladioli, Lilliums, &c.*

Dickson and Robinson, Manchester.—*Seeds.*

Dobbie and Co., Rothsay.—*Spring Catalogue, 1904.*

Little and Ballantyne, The King's Seedsmen, Carlisle.—*Seeds.*

Wells and Co., Ltd., Earlswood, Redhill, Surrey.—*List of New Chrysanthemums.*

B. S. Williams and Son, Upper Holloway, London, N.—*Seeds.*

## Vale !

The year is dying in the night,  
Ring out wild bells and let him die.

The year is going, let him go.  
Ring out the false, ring in the true.

Times and seasons! Days, months, and years tear past us as though harnessed to the horses of the sun! We stand at the threshold of another year. What it brings we know not—weal or woe. We know partially of the past; we realise the present; the future is hidden in dim obscurity. It is well to pause in this our feverish headlong life; to

pause and consider where we stand; like prudent men, to make up our books and face our position. We take so little time to think; we ever hurry to and fro and wear ourselves out before our time with ceaseless toil and restless worry.

Perhaps our readers will be inclined to say that of all vocations that of a farmer is the most tranquil, the most peaceful. It ought to be. There is the close intimacy with Nature in her ever varying moods, and that should soothe petty anxieties and smooth rough ways; but Nature is sometimes more like our idea of a stern stepmother—one who never shows a smiling face to the children of her adoption. This past year has been one of much vicissitude; the days of storm have been so out of proportion to the days of sunshine. Jupiter Pluvius has been in the ascendant. We have hoped that every change of the season would bring more favourable weather; and, indeed, we may bless the days of December as being on the whole far better, pleasanter days than those of many of the preceding months. Just think of that; better December weather than late summer or autumn! There was such promise in the spring of prosperity; but we have learned to distrust mild springs—sooner or later comes the severe check. If it would only come soon it would be beneficial. Plant life is prematurely forced only to be checked beyond hope of recovery.

In the southern provinces the hay crop was a good one, and well got. Further north the crop was again good, but here we pause; it was not got in good condition; and, indeed, a great deal was never got at all—at least in the form of hay. It might be carted into the yards to be trodden under foot, but that was all. It makes an amazing difference; indeed, all the difference the way the crop is secured. Grain crops promised heavy, good crops of Wheat, only grown apparently to be the sport of wind and weather. Storm-tossed, broken, discoloured, difficult to reap, difficult to “condition,” and more difficult to market; nay, almost impossible. We do not take up a farming paper without seeing numerous queries as to how to deal with this damp, spoiled grain. Damaged Wheat is the least suitable of cereals for stock feeding; it is particularly the food of man. For animals it must be used sparingly and carefully. In a ground state it is the safest; but even when ground it is wisest to keep it out of the stable. There is such a desire to use Wheat as a substitute for Oats; a practice of this kind is fatal. If given at all it must be in very small quantities, which should be bruised and given in chaff. Whether wheatmeal is desirable for milk cows is a much debated point. Some great authorities urge its use. Others quite as great would relegate to the fattening steer. One writer, however, would allow 3lbs per head per diem of ground Wheat for milk cows if mixed with chopped straw and boiling water. It may constitute also part of the dry feed for sheep, and as a finishing fatterer for pigs it has no equal.

But as this year there is other spoiled corn as well as Wheat, there is no reason why a mixture should not be made; say equal parts of Wheat, Barley, and Oats—this passed through a mill will make excellent feed, and safe into the bargain, and at the same time will materially lessen the expensive cake bill. It is a most extraordinary thing that with all this spoiled corn and tons and tons upon tons of damaged Potatoes pigs are comparatively cheap. Judging from past experience they should have been dear as mint; but these are things no “fellah can understand.” There is one thing we would recommend, and this is only for young farmers. Give your damp grain a chance to dry and “condition” in the stack; it is marvellous what a change may be wrought by three or four months sojourn in stack. Sometimes it is possible, too, to kiln dry damp corn. And also if you can make anything over 24s. per quarter for Wheat let it go. What a fallacious thing returns are! Here we are told by Lord Onslow that the returns this year showed improvement over the last ten years. “Quantity” rather than “quality,” he adds, Oats, Beans, Peas, and Mangold being above the average. Wheat, Barley, Potatoes, Turnips, and Swedes below. Grass crops, especially hay, much above. A writer analysing the reports speaks very dolefully of all. There is no grain to be recorded; it is simply how little loss, and he puts the loss thus:—“In 1902 the value of all the field crops grown in Great Britain on 16,682,780 acres was about £101,200,000; the value in 1903 with a larger acreage is only about £80,500,000, being a reduction of about £20,700,000, or 25s.

per acre, nearly 21 per cent. This is just for ordinary farm crops; not a word is said about the entire failure of the fruit farmers. It is greatly to be feared also that the fat stock sales have been the occasion of much disappointment. The animals in tiptop condition have certainly not realised their value. We hear on all sides rumours of changes in tenancy, and we feel sure the New Year will find many poor farmers at their wits’ end to make ends meet and to satisfy all lawful demands on their depleted purses.

The only animal that seems never to be a drag in the market is the cow in full milk; she is always bad to find, and therefore always dear, and the problem seems to be how to keep up her milk supply when you have got her. We saw a theory to-day, and one that sounds very reasonable, and it is this; that the milk yield of cows may be and is very much affected by change of residence. A cow is a nervous animal, and as readily falls and rises in her milk estimate as the mercury in the barometer. She is some time getting accustomed to her new surroundings, to her new attendants, and to her new rations, which are never exactly alike in two places. Besides also, for all the buyer knows, she may have been so heavily and continuously milked, almost round to calving, that her constitution needs a certain period of rest. We wish we could impress upon all our readers the desirability of breeding from none but good milking strains and then dedicating all heifers to dairy purposes. There is far too much waste that arises from the breeding of what we may for want of a better word, style “misfits,” neither good for beef or dairy purposes.

We wonder how much nearer we shall be next Christmas to universal motor power. Whether it will come with a rush or whether the slowgoing farmer will be plodding on much as usual. We can but hope for brighter, better days—more sunshine and less rain—for surely now all springs must be so replenished that there can be no fear of a water famine! It is well that a merciful Providence hides the future behind a thick veil; the thought of coming ills will daunt the stoutest heart, and the hope of a better future goes far to raise downcast spirits. Whatever may be in store for us collectively or individually, it is the brave, hard worker who comes out best in the long run.

To all our kindly readers we would tender our grateful thanks, and with all our heart we wish them and theirs the happiest and most prosperous New Year they have ever seen.

### Work on the Home Farm.

Ploughing is still the chief work, belated though much of it, no doubt, may be. Still, we are glad to get the work done under such good conditions for December, and considering the unusual weather we have recently experienced.

We have been sorting and sending away Potatoes, and it is such a difficult matter to make a good sound sample that the work is very expensive of labour. The ware produced costs just twice as much as usual in the sorting process—offals, which amount to about 50 per cent., being, of course, not reckoned.

We have been delivering these Potatoes to the station, and although railway business is supposed to be slack we find great difficulty in obtaining empty waggons; but that is an old complaint. It is somewhat strange to remark it, but work on the land is now easier than it is on the roads. The latter had become very soft through the continuous wet, and the slight frosts have left the surface very much like hasty pudding. Arable land has dried in a marvellous way, and unless we have a wet January there is every prospect that we shall soon commence spring cleaning. Some farmers are hoping for a severe and long frost as the best pulveriser of the sodden soil, but we should like to have all ploughed up before it sets in.

There is always difficulty nowadays in obtaining suitable wood for fencing purposes at a price commensurate with the depth of the farmer's pocket; and the most difficult article to obtain is a good cheap stake. Estates which include large areas of timber provide plenty of stakes, but they are often of a trashy character and cut with a view to satisfy the tenants' outcry rather than a useful purpose. Good ash stakes are useful and easy to work with. They are also easily got ready, but are not nearly as lasting as their appearance would suggest. Larch tops take some labour in trimming and are rougher in appearance, but they wear better. Cheap timber from the seaports may often be obtained, but a large portion is of little use except as firewood, which is not usually a scarce article on the farm.

Cakes, both linseed and cotton, are lower, in sympathy with the depression in grain, and it is a moot question with farmers whether to buy cake or use barley. We would sell barley at anything over 20s. per quarter, but consume it at that price or less. Every animal on the farm will thrive on barley in some proportion.
